## Legal information

### Warning concept

This Manual contains information which you must observe to ensure your own personal safety as well as to avoid material damage. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to equipment damage have no safety alert symbol. Depending on the hazard level, warnings are indicated in a descending order as follows:

 <b>DANGER</b>
indicates that death or serious injury <b>will</b> result if proper precautions are not taken.
 <b>WARNING</b>
indicates that death or serious injury <b>could</b> result if proper precautions are not taken.
 <b>CAUTION</b>
indicates that minor personal injury can result if proper precautions are not taken.
<b>NOTICE</b>
indicates that property damage can result if proper precautions are not taken.

If more than one level of danger is simultaneously applicable, the warning notice for the highest level is used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified personnel

The product/system described in this documentation may only be operated by **personnel qualified** for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

 <b>WARNING</b>
Siemens products are only permitted to be used for the applications envisaged in the catalog and in the associated technical documentation. If third-party products and components are to be used, they must be recommended or approved by Siemens. These products can only function correctly and safely if they are transported, stored, set up, mounted, installed, commissioned, operated and maintained correctly. The permissible ambient conditions must be adhered to. Information in the associated documentation must be observed.

### Trademarks

All names identified by the trademark symbol ® are registered trademarks of Siemens AG. Other designations used in this document may be trademarks whose use by third parties for their own purposes could violate the rights of the trademark owners.

### Disclaimer of liability

We have verified that the contents of this document correspond to the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. The information given in this document is reviewed at regular intervals and any corrections that might be necessary are made in the subsequent editions.

# Preface

## Information about the SINAMICS documentation

The SINAMICS documentation is structured according to the following categories:

- General documentation/catalogs
- Manufacturer/service documentation

This documentation is part of the technical customer documentation for SINAMICS.

In the interests of clarity, this documentation does not contain all the detailed information for all product types and cannot take into account every possible aspect of installation, operation or maintenance.

The contents of this documentation are not part of an earlier or existing agreement, a promise, or a legal agreement, nor do they change this. All obligations on the part of Siemens can be found in the respective sales contract, which also contains the complete and sole warranty provisions. These contractual warranty provisions are neither extended nor curbed as a result of the statements made in this documentation.

## Target group

This documentation addresses commissioning engineers and service personnel who use SINAMICS.

## Objective

This manual contains information about all parameters, function diagrams, faults, and warnings required to commission and service the system.

This manual should be used in addition to the other manuals and tools provided for the product.

## Search tools

The following guides are provided to help you locate information in this manual:

1. Table of contents
  - Table of contents for the complete manual (Page 7)
  - Table of contents for function diagrams (Page 718)
2. List of abbreviations (Page 1275)
3. Index (Page 1289)

## Technical Support

Country-specific telephone numbers for technical support are provided at the following Internet address:

## Compliance with the General Data Protection Regulation

Siemens respects the principles of data protection, in particular the data minimization rules (privacy by design).

For this product, this means:

The product does not process neither store any person-related data, only technical function data (e.g. time stamps). If the user links these data with other data (e.g. shift plans) or if he stores person-related data on the same data medium (e.g. hard disk), thus personalizing these data, he has to ensure compliance with the applicable data protection stipulations.

## 1.1 General safety instructions

### **WARNING**

#### **Danger to life if the safety instructions and residual risks are not observed**

If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

### **WARNING**

#### **Malfunctions of the machine as a result of incorrect or changed parameter settings**

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

## 1.2

### **Warranty and liability for application examples**

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

## 1.3 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit:

Industrial security (<https://www.siemens.com/industrialsecurity>)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at:

Industrial security  
(<https://new.siemens.com/global/en/products/services/cert.html#Subscriptions>).

Further information is provided on the Internet:

Industrial Security Configuration Manual  
(<https://support.industry.siemens.com/cs/ww/en/view/108862708>)

### **WARNING**

#### **Unsafe operating states resulting from software manipulation**

Software manipulations (e.g. viruses, trojans, malware or worms) can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- On completion of commissioning, check all security-related settings.

## 2.1 Overview of parameters

### 2.1.1 Explanation of the parameter list

#### Basic structure of the parameter descriptions

The data in the following example have been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The "List of parameters (Page 28)" has the following structure:

----- **Start of example** -----

<b>pxxxx[0...n]</b>	<b>BICO: Full parameter name / abbreviated name</b>

----- **End of example** -----

The individual pieces of information are described in detail below.

**pxxxx[0...n]      Parameter number**

The parameter number is made up of a “p” or “r”, followed by the parameter number and the index (optional).

Examples of the representation in the parameter list:

- p...                      Adjustable parameters (read and write)
- r...                      Display parameters (read only)
- p0918                    Adjustable parameter 918
- p0099[0...3]          Adjustable parameter 99, indices 0 to 3
- p1001[0...n]          Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944                    Display parameter 944
- r2129.0...15          Display parameter 2129 with bit array from bit 0 (smallest bit) to bit 15 (largest bit)

Other examples of notation in the documentation:

- p1070[1]                Adjustable parameter 1070, index 1
- p2098[1].3             Adjustable parameter 2098, index 1 bit 3
- r0945[2](3)            Display parameter 945, index 2 of drive object 3
- p0795.4                Adjustable parameter 795, bit 4

The following applies to adjustable parameters:

The parameter value when shipped is specified under “Factory setting” with the relevant unit in square parentheses. The value can be adjusted within the range defined by “Min” and “Max”.

The term “linked parameterization” is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions and parameters:

- Executing macros  
p0015, p0700, p1000, p1500
- Setting the PROFIBUS telegram (BICO interconnection)  
p0922
- Setting component lists  
p0400
- Automatically calculating and pre-assigning  
p0112, p0340, p3900
- Restoring the factory settings  
p0970

The following applies to display parameters:

The fields “Min”, “Max” and “Factory setting” are specified with a dash “-” and the relevant unit in square parentheses.

---

**Note:**

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

---

**BICO: Full parameter name/Abbreviated name**

The following abbreviations can appear in front of the parameter name:

- **BI:** Binector Input  
This parameter is used for selecting the source of a digital signal.
- **BO:** Binector Output  
This parameter is available as a digital signal for interconnection with other parameters.
- **CI:** Connector Input  
This parameter is used for selecting the source of an "analog" signal.
- **CO:** Connector Output  
This parameter is available as an "analog" signal for interconnection with other parameters.
- **CO/BO:** Connector/Binector Output  
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

---

**Note:**

A connector input (CI) cannot be just interconnected with any connector output (CO, signal source).

When interconnecting a connector input using the commissioning software, only the signal sources that are actually possible are listed.

---

**Drive object (function module)**

A drive object (DO) is an independent, "self-contained" functional unit that has its own parameters and, in some cases, faults and alarms.

When carrying out commissioning using the commissioning software, you can select/deselect additional functions and their parameters by activating/deactivating function modules accordingly.

The parameter list specifies the associated drive object and function module for each individual parameter.

Example:

- **r61000:** PROFINET Name of Station  
CU\_DC (PROFINET)  
The parameter is only available in the case of the CU\_DC drive object with the "PROFINET" function module.

A parameter can belong to a single, multiple or all drive objects.

The following information relating to "Drive object" and "Function module" can be displayed under the parameter number:

Table 2-1 Data in the "Drive object (function module)" field

Drive object (function module)	Type	Meaning
All objects	-	This parameter is used by all drive objects.
CU_DC	6	Advanced Control Unit SINAMICS DCM (CUD) is to the left.
CU_DC_R	6	Advanced Control Unit SINAMICS DCM (CUD) is to the right.
CU_DC_S	6	Standard Control Unit SINAMICS DCM (CUD) is to the left.
CU_DC_R_S	6	Standard Control Unit SINAMICS DCM (CUD) is to the right.
CU_DC (PROFINET)	-	SINAMICS DCM Control Unit with "PROFINET" function module.
DC_CTRL	17	DC closed-loop control general or DC closed-loop control on the Advanced CUD left.
DC_CTRL_R	17	DC closed-loop control extended on the Advanced CUD right.
DC_CTRL_S	17	DC closed-loop control on the standard CUD right.
DC_CTRL_R_S	17	DC closed-loop control extended on the standard CUD right.
DC_CTRL (PROFINET)	-	DC closed-loop control with "PROFINET" function module.
TM31	200	Terminal Module 31.
TM31 (PROFINET)	-	Terminal Module 31 with "PROFINET" function module.
TM15DI_DO	204	Terminal Module 15 (for SINAMICS).
TM15DI_DO (PROFINET)	-	Terminal Module 15 (for SINAMICS) with "PROFINET" function module.
TM150	208	Terminal Module 150.
TM150 (PROFINET)	-	Terminal Module 150 with "PROFINET" function module.

**Note:**

The drive object type is used to identify the drive objects in the drive system (e.g. r0107, r0975[1]).

### Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The information "C1(x), C2(x), T, U" ((x): optional) means that the parameter can be changed only in the specified drive unit state and that the change will not take effect until the unit switches to another state. This can be a single state or multiple states.

The following states are available:

- C1(x) Device commissioning C1: Commissioning 1  
Device is being commissioned (p0009 > 0).  
Pulses cannot be enabled.  
The parameter can only be changed for the following device commissioning settings (p0009 > 0):
  - C1: Can be changed for all settings p0009 > 0.
  - C1(x): Can be changed only when p0009 = x.A modified parameter value does not take effect until the device commissioning mode is exited with p0009 = 0.
  
- C2(x) Drive object commissioning C2: Commissioning 2  
Drive commissioning is in progress (p0009 = 0 and p0010 > 0).  
Pulses cannot be enabled.  
The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
  - C2: Can be changed for all settings p0010 > 0.
  - C2(x): Can only be changed for the settings p0010 = x.A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
  
- U Operation U: Run  
Pulses are enabled.
  
- T Ready T: Ready to run  
The pulses are not enabled and the state "C1(x)" or "C2(x)" is not active.

---

#### Note

Parameter p0009 is CU-specific (belongs to the Control Unit).

Parameter p0010 is drive-specific (belongs to each drive object).

The operating state of individual drive objects is displayed in r0002.

---

## Calculated

Specifies whether the parameter is influenced by automatic calculations.

The calculation attribute defines which activities influence the parameter.

The following attributes apply:

- CALC\_MOD\_ALL
  - p0340 = 1
- CALC\_MOD\_CON
  - p0340 = 1
- CALC\_MOD\_EQU
  - p0340 = 1
- CALC\_MOD\_LIM\_REF
  - p0340 = 1, 5
- CALC\_MOD\_REG
  - p0340 = 1, 3

---

**Note:**

For p3900 > 0, p0340 = 1 is also called automatically.

---

## Access level

Specifies the minimum access level required to be able to display and change the relevant parameter. The required access level can be set using p0003.

The system uses the following access levels:

- 1: Standard
- 2: Extended
- 3: Expert
- 4: Service

---

**Note**

Parameter p0003 is CU-specific (belongs to the Control Unit).

A higher access level will also include the functions of the lower levels.

---

## Data type

The information on the data type can consist of the following two items (separated by a slash):

- First item  
Data type of the parameter.
- Second item (for binector or connector input only)  
Data type of the signal source to be interconnected (binector/connector output).

## 2 Parameters

### 2.1 Overview of parameters

Parameters can have the following data types:

- Integer8                I8        8-bit integer number
- Integer16              I16       16-bit integer number
- Integer32              I32       32-bit integer number
- Unsigned8              U8        8 bits without sign
- Unsigned16             U16       16 bits without sign
- Unsigned32             U32       32 bits without sign
- FloatingPoint32       Float      32-bit floating point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when creating BICO interconnections:

Table 2-2 Possible combinations of BICO interconnections

BICO output parameter	BICO input parameter			
	CI parameter			BI parameter
	Unsigned32 / Integer16	Unsigned32 / Integer32	Unsigned32 / FloatingPoint32	Unsigned32 / Binary
CO: Unsigned8	x	x	–	–
CO: Unsigned16	x	x	–	–
CO: Integer16	x	x	r2050, r8850	–
CO: Unsigned32	x	x	–	–
CO: Integer32	x	x	r2060, r8860	–
CO: FloatingPoint32	x	x	x	–
BO: Unsigned8	–	–	–	x
BO: Unsigned16	–	–	–	x
BO: Integer16	–	–	–	x
BO: Unsigned32	–	–	–	x
BO: Integer32	–	–	–	x
BO: FloatingPoint32	–	–	–	–

Legend:

- x : BICO interconnection permitted
- : BICO interconnection not permitted
- rxxxx: BICO interconnection is only permitted for the specified CO parameters

### Dynamic index

For parameters with a dynamic index [0...n], the following information is specified here:

- Data set (if available).
- Parameter for the number of indices (n = number - 1).

The following information can be contained in this field:

- "CDS, p0170" (Command Data Set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (Drive Data Set, DDS count)
  - "EDS, p0140" (Encoder Data Set, EDS count)
- 

**Note:**

Information on the data sets can be taken from the following references:

References: SINAMICS DC MASTER operating instructions  
"Data sets" Chapter

---

### Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

### P group (only when accessing via BOP (Basic Operator Panel))

Specifies the functional group to which this parameter belongs. The required parameter group can be set via p0004.

---

**Note:**

Parameter p0004 is CU-specific (belongs to the Control Unit).

---

### Unit, unit group and unit selection

The standard unit of a parameter is specified in square parentheses after the values for "Min", "Max", and "Factory setting".

---

**Note:**

The units cannot be switched over for SINAMICS DCM.

The information under unit group and unit selection has no relevance.

---

#### Parameter values

Min.	Minimum value of the parameter [unit]
Max	Maximum value of the parameter [unit]
Factory setting	Value when delivered [unit]

In the case of a binector/connector input, the signal source of the default BICO interconnection is specified. A non-indexed connector output is assigned the index [0].

#### Not for motor type

This information is of no relevance for SINAMICS DC MASTER.

#### Scaling

Specification of the reference variable with which a signal value is automatically converted with a BICO interconnection.

The following reference variables are available:

- p2000 ... p2007: Reference speed, reference voltage, etc.
- PERCENT: 1.0 = 100 %
- 4000H: 4000 hex = 100 %

#### Expert list

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software.

1: Parameter exists in the expert list.

0: Parameter is not available in the expert list.

#### NOTICE

Users are themselves responsible for using parameters marked "Expert list: 0" (parameter does not exist in the expert list).

These parameters and their functionalities have not been tested and no further user documentation is available for them (e.g. description of functions). Furthermore, no support is provided for these parameters by "Technical Support" (hotline).

**Description**

Explanation of the function of a parameter

**Values**

Lists the possible values of a parameter.

**Recommendation**

Information about recommended settings.

**Index**

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:

The adjustment range and unit apply to all indices.

- Factory setting:

When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.

When the indices have different factory settings, they are all listed individually with the unit.

**Bit field**

For parameters with bit fields, the following information is provided about each bit:

- Bit number and signal name
- Meaning for signal states 1 and 0
- Function diagram (optional)

The signal is shown on this function diagram.

**Dependency**

Conditions that must be fulfilled in conjunction with this parameter. Also includes special effects that can occur between this parameter and others.

See also: List of other parameters to be additionally considered.

## Safety guidelines

Important information that must be observed to avoid the risk of physical injury or material damage.

Information that must be observed to avoid any problems.

Information that the user may find useful.

**Danger**

The description of this safety notice can be found at the beginning of this manual, see "Legal information (Page 4)".

**Warning**

## 2.1.2 Number ranges of parameters

### Number ranges for SINAMICS in general

**Note:**

The following number ranges represent an overview for all the parameters available for the SINAMICS drive family.

The parameters for the product described in this List Manual are described in detail in "List of parameters (Page 28)".

Parameters are grouped into the following number ranges:

Table 2-3 Number ranges for SINAMICS

Range		Description
From	To	
0000	0099	Display and operation
0100	0199	Commissioning
0200	0299	Power section
0300	0399	Motor
0400	0499	Encoder
0500	0599	Technology and units, motor-specific data, probes

**Notice:** The display filter via p0004 provides precise filtering and displays the corresponding parameters only when p0009 and p0010 = 0.

**Note:** The set access level via p0003 is also relevant for the display filter via p0004.

Examples (assumption: p0009 = p0010 = 0):

p0003 = 1, p0004 = 3

--> Only the parameters for the motor with access level 1 are displayed.

p0003 = 2, p0004 = 3

--> Only the parameters for the motor with access levels 1 and 2 are displayed.

**Index:**  
[0] = Parameter number  
[1] = Parameter index

**Dependency:** See also: p0006

**Note:** Procedure:

1.

The parameter number to be displayed should be set in index 0. Only the monitoring parameters (read-only parameters) can be set that actually exist for the actual drive object.

If the set parameter number is not indexed, or if there is an index in index 1 that lies outside the valid range of the set parameter, then index 1 is automatically set to 0.

2.

The index that belongs to the parameter set in index 0 should be set in index 1. The permissible changes in index 1 always depend on the parameter number set in index 0.

<b>Value:</b>	0: Ready 1: Device configuration 2: Defining the drive type/function module 3: Drive base configuration 4: Data set base configuration 29: Device download 30: Parameter reset 50: Configure Technology Extension 55: Install Technology Extension		
<b>Note:</b>	<p>The drives can only be switched on outside the device commissioning (the drive enabled). In this case, p0009 must be 0 (Ready) and the individual drive objects must have already gone into operation (p0010).</p> <p>p0009 = 0: ready When changing into this state, the device configuration is checked and commissioning completed (a new start can be initiated).</p> <p>p0009 = 1: Device configuration At the first commissioning of the device, after booting, the device is in the "device configuration" state. To start the internal automatic first commissioning of the drive unit, p0009 should be set to 0 (Ready) after the ID for the actual topology (r0098) was transferred into the ID for the target topology (p0099). To do this, it is sufficient to set a single index value of p0099[x] the same as r0098[x]. Before the device has been completely commissioned, no other parameter can be changed. After the first commissioning was carried out, in this state, when required, other basic device configuration parameters can be adapted (e.g. the basic sampling time in p0110).</p> <p>p0009 = 2: Defines the drive type / function module In this state, the drive object types and/or the function modules can be changed or selected for the individual drive objects. To do this, the drive object type can be set using p0107[0...15] and the function can be set using p0108[0...15] (refer to p0101[0...15]).</p> <p>p0009 = 3: Drive basic configuration In this state, after the device has been commissioned for the first time, basic changes can be made for the individual drive objects (e.g. sampling times in p0111, p0112, p0115 and the number of data sets in p0120, p0130, p0140, p0170, p0180).</p> <p>p0009 = 4: Data set basic configuration In this state, after the device has been commissioned for the first time, for the individual drive objects changes can be made regarding the assignment of the components (p0121, p0131, p0141, p0151, p0161) to the individual data sets and the assignment of the power unit, motor and encoder to the drive data sets (p0185, ...).</p> <p>p0009 = 29: Device download In the case of a download via the commissioning tool, the device is automatically brought into this state. After the download has been completed, p0009 is automatically set to 0 (ready). It is not possible to manually set p0009 to this value.</p> <p>p0009 = 30: Parameter reset In order to bring the complete unit into the "first commissioning" state or to load the parameters saved using p0977, to start, p0009 must be set to this value. p0976 can then be changed to the required value.</p> <p>p0009 = 50: configure Technology Extension After the device has been commissioned for the first time, in this state, Technology Extensions can be activated/deactivated for the individual drive objects (p4956).</p> <p>p0009 = 55: install Technology Extension Technology Extensions can be installed/uninstalled in this state.</p>

**Description:** Sets the parameter filter to commission a drive.  
Setting this parameter filters out the parameters that can be written into in the various commissioning steps.

**Value:** 0: Ready  
1: Quick commissioning  
4: Encoder commissioning  
15: Data sets  
29: Only Siemens internal  
30: Reserved

**Note:** The drive can only be switched on outside the drive commissioning (drive enable). To realize this, this parameter must be set to 0.  
By setting p3900 to a value other than 0, the quick commissioning is completed, and this parameter is automatically reset to 0.

**Note:** The value r0046 = 0 indicates that all enable signals are present.

Bit 00 = 1 (enable signal missing), if:

- the signal source in p0840 is a 0 signal.
- there is a "switching on inhibited".

Bit 01 = 1 (enable signal missing), if:

- the signal source in p0844 or p0845 is a 0 signal.

Bit 03 = 1 (enable signal missing), if:

- the signal source in p0852 is a 0 signal.

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:

- OFF2 fault response is active or the OFF1 signal source (p0840) is changed.

<b>Description:</b>	Displays the automatically detected actual device topology in coded form.		
<b>Index:</b>	[0] = DRIVE-CLiQ socket X100 [1] = DRIVE-CLiQ socket X101 [2...5] = Reserved		
<b>Dependency:</b>	See also: p0097, p0099		
<b>Note:</b>	Topology coding: abcd efgh hex a = 0 b = 0 c = 0 d = no. of motor encoders e = no. of additional encoders f = number of Terminal Modules g = number of Terminal Boards h = reserved if the value 0 is displayed in all indices, then components are not detected via DRIVE-CLiQ. If a value F hex occurs at a position of the coding (abcd efgh hex), then an overflow has occurred.

<b>p0099[0...5]</b>	<b>Device target topology / Device_target topo</b>		
CU_DC_S, CU_DC_R_S, CU_DC, CU_DC_R	<b>Can be changed:</b> C1(1)	<b>Calculated:</b> -	<b>Access level:</b> 1

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 0000 hex	<b>Max:</b> FFFF FFFF hex	<b>Factory setting:</b> 0000 hex
<b>Description:</b>	Sets the device target topology in coded form (refer to r0098). The setting is made during commissioning. Deactivated or non-available components are also counted		
<b>Index:</b>	[0] = DRIVE-CLiQ socket X100 [1] = DRIVE-CLiQ socket X101 [2...5] = Reserved		

<b>Dependency:</b>	The parameter can only be written into for p0097 = 0. To perform an automatic device configuration run, an index of the device target topology must be set to the value of the device actual topology in r0098 for acknowledgment. An index of the device actual topology with a value other than 0 must be selected. See also: p0097, r0098 See also: A01330
<b>Note:</b>	The parameter can only be set to the values 0, the value of the actual device topology, the value of the actual device target topology and FFFFFFFF hex. If the value 0 is displayed in all of the indices, then the system has still not been commissioned. The value FFFFFFFF hex indicates that the topology was not generated by the automatic device configuration, but was commissioned using the commissioning tool (e.g. using parameter download).

<b>Description:</b>	The parameter contains the object number via which every drive object can be addressed. The number of an existing drive object is entered into each index. Value = 0: No drive object is defined.		
<b>Note:</b>	The numbers are automatically allocated. For the commissioning tool, this object number cannot be entered using the expert list, but is automatically assigned when inserting an object.

**Description:** The function module of an existing drive object is entered into each index (also refer to p0101, p0107).

The following bits are available for the Control Unit (Index 0):

Bit 18: Free function blocks

Bit 31: PROFINET

For all other drive objects (Index > 0), the significance of the bits should be taken from the display parameters r0108 of the drive object.

<b>Description:</b>	Sets the sampling times for the control loops. The default setting is made using p0112 and can only be individually changed for p0112 = 0 (expert).		
<b>Index:</b>	[0] = Current controller [1] = Speed controller [2] = - [3] = Setpoint channel [4] = - [5] = - [6] = Technology controller		
<b>Dependency:</b>	The sampling times can only be separately set if p0112 is 0 (expert). If a sampling time is modified in the expert mode, then all of the sampling times with higher indices are automatically changed in the same ratio as the sampling time itself was changed. Slower time slices are only taken if the calculated sampling time is also permitted. Upper limit is 8 ms. Higher-level controls must be calculated in integral ratios to lower-level controls (e.g. p0115[1] = N * p0115[0]; where N is an integer number). The sampling time of the speed controller (p0115[1]) can have as a maximum a value of 800% of the current controller sampling time (p0115[0]). See also: r0110, r0111, p0112		
<b>Note:</b>	For function modules that can be activated (e.g. technology controller), the parameters values are pre-assigned. The current controller sampling time (p0115[0]) is permanently set to 1 ms and cannot be changed.

### 2.2 List of parameters

<b>Dependency:</b>	See also: A01314, A01317
<b>Caution:</b>	For a parallel connection, the following applies:
	When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.
<b>Notice:</b>	It is not permissible to deactivate drive objects with safety functions enabled.
<b>Note:</b>	The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. For units connected in parallel, when one of the power units is deactivated, then the enable in p7001 is withdrawn. For value = 0, 2: When a component is deactivated it no longer outputs any errors. If value = 0: The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error. If value = 1: The component must be available for error-free operation. If value = 2: A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start. This means that the component is marked to be bypassed in the DRIVE-CLiQ line. For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

**Note:** The deactivation of an encoder interface corresponds to the "parking encoder" function and has the same effect. The activation of a component can be rejected if the component was inserted for the first time. In this case, it is only possible to activate the component when the pulses for all of the drive objects are inhibited. With the encoder interface for encoder 1 (motor encoder), the relevant drive object for writing the parameter must be in the "Ready for operation" state. With the encoder interface for encoders 2 and 3, the parameter can also be written during operation. For value = 0, 2: When a component is deactivated it no longer outputs any errors. If value = 0: The component was completely commissioned and is deactivated using this value. It can be removed from the DRIVE-CLiQ without any error. If value = 1: The component must be available for error-free operation. If value = 2: A component in a project generated offline and set to this value must never be inserted in the actual topology from the very start. For components that comprise several individual components (e.g. Double Motor Modules), it is not permissible to set just one subset to this value.

**Note:**

For bit 03 ... 00:

Bit 3, 2, 1, 0 = 0, 0, 0, 0 --> component not available.  
 Bit 3, 2, 1, 0 = 0, 0, 0, 1 --> power up, non-cyclic DRIVE-CLiQ communication (LED = orange).  
 Bit 3, 2, 1, 0 = 0, 0, 1, 0 --> operating mode, cyclic DRIVE-CLiQ communication (LED = green).  
 Bit 3, 2, 1, 0 = 0, 0, 1, 1 --> alarm (LED = green).  
 Bit 3, 2, 1, 0 = 0, 1, 0, 0 --> fault (LED = red).  
 Bit 3, 2, 1, 0 = 0, 1, 0, 1 --> detection via LED and operating mode (LED = green/orange).  
 Bit 3, 2, 1, 0 = 0, 1, 1, 0 --> detection via LED and alarm (LED = green/orange).  
 Bit 3, 2, 1, 0 = 0, 1, 1, 1 --> detection via LED and fault (LED = red/orange).  
 Bit 3, 2, 1, 0 = 1, 0, 0, 0 --> firmware being downloaded (LED = green/red with 0.5 Hz).  
 Bit 3, 2, 1, 0 = 1, 0, 0, 1 --> firmware download completed, wait for POWER ON (LED = green/red with 2.0 Hz).

For bits 12 ... 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

**Note:** ZM: Zero mark  
SMC: Sensor Module Cabinet

If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:  
The track A/B is adjusted to match the magnetic position of the motor.

For bit 01, 02 (absolute encoder, multiturn encoder):  
These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.

For bit 10 (DRIVE-CLiQ encoder):  
This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.

For bit 12 (equidistant zero mark):  
The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).  
The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.

For bit 13 (irregular zero mark):  
The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.

For bit 14 (distance-coded zero mark):  
The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

For bit 15 (commutation with zero mark):  
Only applicable for synchronous motors.  
The function can be de-selected by priority via p0430.23.  
For distance-coded zero marks, the following applies:  
The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).  
The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.  
The fine synchronization is only started after two zero marks have been passed.

<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.			
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).			

## 2 Parameters

### 2.2 List of parameters

**Note:** The resolution that is set must be able to be represented using r0483.  
 For rotary axes/modulo axes, the following applies:  
 p0411.0 = 1:  
 This parameter is pre-set with p0421 and can be changed.  
 p0411.3 = 1:  
 The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).  
 For linear axes, the following applies:  
 p0411.0 = 1:  
 This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.  
 p0411.3 = 1:  
 The parameter value is pre-set to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

p0413[0...n]	Measuring gear position tracking tolerance window / Pos track window

	<b>Min:</b> 0.00	<b>Max:</b> 4294967300.00	<b>Factory setting:</b> 0.00

**Description:** Sets a tolerance window for position tracking.  
 After the system is switched on, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated:  
 Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value.  
 Difference outside the tolerance window --> An appropriate message is output.

**Dependency:** See also: F31501, F32501

**Caution:** Rotation, for example through a complete encoder range is not detected.

**Note:** The value is entered in integer (complete) encoder pulses.  
 For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range.  
 Example:  
 Quarter of the encoder range = (p0408 \* p0421) / 4  
 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

DC_CTRL_R	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>

**Description:** Sets the fine resolution in bits of the incremental position actual values.

**Note:** The parameter applies for the following process data:

- Gx\_XIST1
- Gx\_XIST2 for reference mark or flying measurement

The fine resolution specifies the fraction between encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048).

For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information.

For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy.

	<b>Min:</b> 0 [µs]	<b>Max:</b> 65535 [µs]	<b>Factory setting:</b> 30 [µs]

**Description:** Sets the minimum delay time between two data transfers of the absolute value for an SSI encoder.

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

p0429[0...n]	Encoder SSI configuration / Enc SSI config

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> -	<b>Max:</b> -	<b>Factory setting:</b> 0000 0000 bin

**Description:** Sets the configuration for an SSI encoder.

Bit array:	Bit	Signal name	1 signal	0 signal	FP
	00	Transfer code	Binary code	Gray code	-
	02	Transfer absolute value twice	Yes	No	-
	06	Data line during the monoflop time	High level	Low level	-

**Notice:** This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).  
When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

**Note:** For bit 06:  
The quiescent signal level of the data line corresponds to the inverted, set level.

p0430[0...n]	Sensor Module configuration / SM config		
DC_CTRL_S, DC_CTRL_R_S, DC_CTRL, DC_CTRL_R	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3

	<b>Min:</b> -	<b>Max:</b> -	<b>Factory setting:</b> 1110 0000 0000 1000 0000 0000 0000 0000 bin

**Description:** Sets the configuration of the Sensor Module.

Bit array:	Bit	Signal name	1 signal	0 signal	FP
	17	Burst oversampling	Yes	No	-
	18	Continuous oversampling (reserved)	Yes	No	-
	19	Safety position actual value sensing	Yes	No	-
	20	Speed calculation mode (only SMC30)	Incremental diff	Flank time meas	-

21	Zero mark tolerance	Yes	No	-
22	Rotor position adaptation	Yes	No	-
23	De-select commutation with zero mark	Yes	No	-
24	Commutation with selected zero mark	Yes	No	-
25	Switch off encoder voltage supply during parking	Yes	No	-
27	Extrapolate position values	Yes	No	-
28	Cubic correction	Yes	No	-
29	Phase correction	Yes	No	-
30	Amplitude correction	Yes	No	-
31	Offset correction	Yes	No	-

**Notice:** A bit-wise configuration is only possible if the corresponding property is also present in r0458.

**Note:**

For bit 17 (burst oversampling):  
- if bit = 1, burst oversampling is switched on.

For bit 18 (continuous oversampling):  
- if bit = 1, continuous oversampling is switched on.

For bit 19 (Safety position actual value sensing):  
- if bit = 1, the Safety position actual value is transferred in the cyclic telegram.

For bit 20 (speed calculation mode):  
- if bit = 1, the speed is calculated via incremental difference without extrapolation.  
- if bit = 0, the speed is calculated via edge time measurement with extrapolation. p0453 is effective in this mode.

For bit 21 (zero mark tolerance):  
- if bit = 1, a one-off zero mark distance error is tolerated. In the event of a defect, the fault F3x100/F3x101 does not appear, but alarm A3x400/A3x401 does.

For bit 22 (rotor position adaptation):  
- if bit = 1, the rotor position is corrected automatically. The correction speed is +/-1/4 encoder pulse per zero mark distance.

For bit 23 (de-select commutation with zero mark):  
- the bit should only be set for encoders that have not been adjusted.

For bit 24 (commutation with selected zero mark):  
- if bit = 1, the commutation position is corrected via a selected zero mark.

For bit 25 (disconnect the encoder power supply on parking):  
- if bit = 1, the encoder power supply is switched off on parking (0 V).  
- if bit = 0, the encoder power supply is not switched off on parking, it is reduced from 24 V to 5 V.

For bit 27 (extrapolate position values):  
- if bit = 1, the extrapolation of the position values is activated.

For bit 28 (cubic correction):  
- if bit = 1, the cubic correction for track A/B sine is activated.

For bit 29 (phase correction):  
- if bit = 1, the phase correction for track A/B sine is activated.

For bit 30 (amplitude correction):  
- if bit = 1, the amplitude correction for track A/B sine is activated.

For bit 31 (offset correction):  
- if bit = 1, the offset correction for track A/B sine is activated.

**p0431[0...n]****Angular commutation offset / Ang\_com offset**

DC_CTRL_S,	<b>Can be changed:</b> C2(4)	<b>Calculated:</b> -	<b>Access level:</b> 3

**Description:** Sets the angular commutation offset.

**Notice:** The angular commutation offset cannot be generally taken from other drive systems.

## 2 Parameters

### 2.2 List of parameters

**Note:** Angular commutation offset, angular difference between electrical position of encoder and flux position.  
For p0404.5 = 1 (track C/D) the following applies:  
The angular offset in p0431 acts on track A/B, the zero mark on track C/D.  
For p0404.6 = 1 (Hall sensor) the following applies:  
The angular offset in p0431 acts on track A/B and the zero mark.

<b>Description:</b>	Sets the position and level of the error bit in the SSI protocol.		
<b>Notice:</b>	The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.		

**Note:** Value = dcba  
 ba: Position of the error bit in the protocol (0 ... 63).  
 c: Level (0: Low level, 1: High level).  
 d: Status of the evaluation (0: Off, 1: On with 1 error bit, 2: On with 2 error bits ... 9: On with 9 error bits).  
 For several error error bits, the following applies:  
 - the position specified under ba and the additional bits are assigned increasing consecutively.  
 - the level set under c applies to all error bits.  
 Example:  
 p0434 = 1013

<b>Dependency:</b>	See also: p0430, r0459																																																																																								

- Note:** A value of zero is displayed if an encoder is not present.
- For bit 00:  
When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.
- For bit 01:  
If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.  
For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark.
- For bit 02:  
When the bit is set, for a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulse number is corrected. If the bit is not set, encoder fault F3x131 is triggered.
- For bits 05, 04:  
The actual hardware only supports 1x or 4x signal evaluation.  
Bit 5/4 = 0/0: Signal evaluation per period, 4x.  
Bit 5/4 = 1/0: signal evaluation per period, 4x with speed calculation over the complete pulse.  
Bit 5/4 = 0/1: Signal evaluation per period, 1x.  
Bit 5/4 = 1/1: Illegal setting.
- For bit 06:  
If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller sampling times. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.
- For bit 07:  
When the bit is not set, the incorrect pulses that have occurred up until now are accumulated in p4688.  
When the bit is not set, p4688 indicates the incorrect pulses that have still not been corrected.
- For bit 11:  
If the bit is set, the Sensor Module checks within a certain time grid whether the fault cause is still present. This enables the Sensor Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.
- For bit 12:  
Additional fault messages can be activated for extended fault diagnostics.
- For bit 13:  
When the bit is set, for an incremental encoder with zero mark, the absolute value in Gn\_XIST2 can be requested via Gn\_STW.13. The absolute value is only valid after passing the zero mark.
- For bit 22:  
When the bit is set, the resolution of the absolute position in the serial protocol is set using distribution factor in p4630. The resolution for the absolute position is then calculated using p0407/p4630.
- For bit 26:  
Track monitoring is deactivated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p0405.2.
- For bit 28:  
Monitoring of the difference between incremental and absolute position in the case of linear encoders.
- For bit 29:  
When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.
- For bit 31:  
When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

## 2 Parameters

### 2.2 List of parameters

<b>p0438[0...n]</b>	<b>Squarewave encoder filter time / Enc t_filt</b>		
DC_CTRL_S, DC_CTRL_R_S, DC_CTRL, DC_CTRL_R	<b>Can be changed:</b> C2(4) <b>Data type:</b> FloatingPoint32 <b>P group:</b> Encoder <b>Not for motor type:</b> - <b>Min:</b> 0.00 [µs]	<b>Calculated:</b> - <b>Dyn. index:</b> EDS, p0140 <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 100.00 [µs]	<b>Access level:</b> 3 <b>Function diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> 0.64 [µs]
<b>Description:</b>	Sets the filter time for a squarewave encoder. The hardware of the squarewave encoder only supports the following values: 0: No filtering 0.04 µs 0.64 µs 2.56 µs 10.24 µs 20.48 µs		
<b>Dependency:</b>	See also: r0452		
<b>Notice:</b>	If the filter time is too long, the track signals A/B/R may be suppressed and the appropriate messages output.		
<b>Note:</b>	The most suitable filter time depends on the number of pulses and maximum speed of the square-wave encoder. The filter time is automatically corrected to the next value when entering a non-specified value. In this case, no message is output. The effective filter time is displayed in r0452.

<b>p0439[0...n]</b>	<b>Encoder ramp-up time / Enc ramp-up time</b>		
DC_CTRL_S, DC_CTRL_R_S, DC_CTRL, DC_CTRL_R	<b>Can be changed:</b> C2(4) <b>Data type:</b> Unsigned16 <b>P group:</b> Encoder <b>Not for motor type:</b> - <b>Min:</b> 0 [ms]	<b>Calculated:</b> - <b>Dyn. index:</b> EDS, p0140 <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 65535 [ms]	<b>Access level:</b> 3 <b>Function diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> 0 [ms]
<b>Description:</b>	Sets the ramp-up time for the encoder. The encoder supplies stable track signals once this time has elapsed.		
<b>Dependency:</b>	This function can only be used when a Sensor Module property is available (r0459.9 = 1).		
<b>Notice:</b>	This parameter is automatically preassigned for encoders from the encoder list and for identify encoder (p0400).

<b>Description:</b>	Copies the actual serial number of the encoder belonging to this Encoder Data Set (EDS) to p0441 ... p0445. Example: For p0440[0] = 1, the serial number of the encoder belonging EDS0 is copied to p0441[0] ... p0445[0].		
<b>Value:</b>	0: No action 1: Transfer serial number

**Note:** For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440. Copying is automatically started in the following cases:

- 1.) When commissioning 1FT6, 1FK6, 1FK7 motors.
- 2.) When writing into p0431.
- 3.) For p1990 = 1.

p0440 is automatically set to 0 when the copying has been completed.  
In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

**Note:** A value of zero is displayed if an encoder is not present.

For bit 11:

When the property is set, the following parameters can be changed without the actual value in the encoder interface becoming invalid (state r0481.14 = 1 "parking encoder active"):

p0314, p0315, p0430, p0431, p0441, p0442, p0443, p0444, p0445

For bit 12:

The extended functions can be configured using p0437.

For bit 13:

Encoder faults can be acknowledged via Gn\_STW.15.

For bit 14:

Only for internal Siemens use.

For bit 23:

When the property is set, commutation with zero mark can be de-selected using p0430.23.

For bit 24:

If the property is set, commutation to the selected zero mark can be carried out.

<b>Caution:</b>	Following ramping-up or after a data set changeover, the new value is present at connector inputs which are interconnected to connector output r0479 and under certain circumstances take 100 ms to become available. Reason: These interconnections are updated in the background, unlike interconnections involving other connector outputs (e.g. CO: r0482). The value is immediately available when non-cyclically reading r0479 (e.g. via the expert list).

For bit 14, 15:  
 r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:

- the encoder is parked.
- the encoder is deactivated.
- the encoder is being commissioned.
- no parameterized encoder available.
- encoder data set is being changed over.

r0481.14 = 1 and r0481.15 = 1 has the following significance:  
 An encoder error has occurred and the encoder position actual value (Gn\_XIST1) is invalid.

**Description:** Display and connector output for the encoder actual position value Gn\_XIST1 according to PROFIdrive.

**Index:**  
 [0] = Encoder 1  
 [1] = Encoder 2  
 [2] = -

- Note:**
- this value is reset if necessary when the "parking encoder" (r0481.14) function is de-selected.
  - in this value, the measuring gear (p0432, p0433) is only taken into account when the position tracking is activated (p0411.0 = 1).
  - the update time for the position control (EPOS) corresponds to the position controller clock cycle (p0115[4]).
  - the update time in isochronous operation corresponds to the bus cycle time r2064[1].
  - the update time in isochronous operation and with position control (EPOS) corresponds to the position controller sampling time (p0115[4]).
  - the update time in non-isochronous operation or without position control (EPOS) must be determined from the default bus cycle time and the minimum cycle time:  
The default bus cycle time is the lowest common multiple (LCM) of all current controller sampling times (p0115[0]) in the drive group (infeed + drives).  
The minimum cycle time is four times the maximum of all current controller sampling times (p0115[0]) in the drive group (infeed + drives).
  - If the minimum cycle time is greater than the default bus cycle time, then the update time corresponds to the minimum cycle time; otherwise, the update time corresponds to the default bus cycle time.
  - The minimum update time is 1 ms.
- Example 1: infeed, servo  
 Default bus cycle time = KGV(250 µs, 125 µs) = 250 µs  
 Minimum cycle time = 4 \* MAX(250 µs, 125 µs) = 4 \* 250 µs = 1 ms  
 -> update time = 1 ms
- Example 2: infeed, servo, vector  
 Default bus cycle time = KGV(250 µs, 125 µs, 400 µs) = 2 ms  
 Minimum cycle time = 4 \* MAX(250 µs, 125 µs, 400 µs) = 4 \* 400 µs = 1.6 ms  
 -> update time = 2 ms

## 2 Parameters

### 2.2 List of parameters

**Recommendation:** When the setting for this binector input is changed, the motor can only be switched on by means of an appropriate signal change of the source.

**Dependency:** See also: p1055, p1056

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** For binector input p0840 = 0 signal, the motor can be moved, jogging using binector input p1055 or p1056. The command "ON/OFF (OFF1)" can be issued using binector input p0840 or p1055/p1056. For binector input p0840 = 0 signal, the switching on inhibited is acknowledged. Only the signal source that originally switched on can also switch off again. The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** For drives with closed-loop speed control (p50084 = 1), the following applies:  
- BI: p0840 = 0 signal: OFF1 (braking with the ramp-function generator, then pulse suppression and switching on inhibited)  
For drives with closed-loop torque control (p50084 = 2), the following applies:  
- BI: p0840 = 0 signal: immediate pulse suppression  
For drives with closed-loop speed/torque control, the following applies:  
- BI: p0840 = 0/1 signal: ON (pulses can be enabled)

**Description:** Sets the second signal source for the command "No quick stop/quick stop (OFF3)".  
The following signals are AND'ed:  
- BI: p0848 "No quick stop / quick stop (OFF3) signal source 1"  
- BI: p0849 "No quick stop / quick stop (OFF3) signal source 2"  
For the PROFIdrive profile, the result of the AND logic operation corresponds to control word 1 bit 2 (STW1.2).  
BI: p0848 = 0 signal or BI: p0849 = 0 signal  
- OFF3 (braking along the OFF3 ramp (p50296), then pulse suppression and switching on inhibited)  
BI: p0848 = 1 signal and BI: p0849 = 1 signal  
- no OFF3 (enable is possible)

**Caution:** When "master control from PC" is activated, this binector input is effective.

**Description:** Sets the signal source for the command "enable operation/inhibit operation".  
For the PROFIdrive profile, this command corresponds to control word 1 bit 3 (STW1.3).  
BI: p0852 = 0 signal  
Inhibit operation (suppress pulses).  
BI: p0852 = 1 signal  
Enable operation (pulses can be enabled).

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Description:** Sets the signal source for the command "control by PLC/no control by PLC".  
For the PROFIdrive profile, this command corresponds to control word 1 bit 10 (STW1.10).  
BI: p0854 = 0 signal  
No control by PLC  
BI: p0854 = 1 signal  
Master control by PLC.

**Caution:** When "master control from PC" is activated, this binector input is ineffective.

**Notice:** The parameter may be protected as a result of p0922 or p2079 and cannot be changed.

**Note:** This bit is used to initiate a response for the drives when the control fails (F07220). If there is no control available, then binector input p0854 should be set to 1.  
If a control is available, then STW1.10 must be set to 1 (PZD1) so that the received data is updated. This applies regardless of the setting in p0854 and even in the case of free telegram configuration (p0922 = 999).

## 2 Parameters

### 2.2 List of parameters

**Note:** A factory setting run can only be started if p0010 was first set to 30 (parameter reset).  
At the end of the calculations, p0970 is automatically set to 0.  
Parameter reset has been completed if p0970 and p0010 have been set to 0.  
For p0970 = 5 the following applies:  
The password for Safety Integrated must be set.  
When Safety Integrated is enabled, this can result in error messages, which then require an acceptance test to be performed.  
Then save the parameters and carry out a POWER ON.

**Description:** Setting to save the parameter of the particular drive object in the non-volatile memory.  
When saving, only the adjustable parameters intended to be saved are taken into account.

**Value:** 0: Inactive  
1: Save drive object

**Dependency:** See also: p0977, r3996

**Alarm:**  If the Control Unit power supply is switched off while data is being saved, then the backup of all adjustable parameters can be lost, and the Control Unit must be recommissioned.

**Caution:**  If a memory card (optional) is inserted, the following applies:  
The parameters are also saved on the card and therefore overwrite any existing data!

**Notice:** The Control Unit power supply may only be switched off after data has been saved (i.e. after data save has been started, wait until the parameter again has the value 0).  
Writing to parameters is inhibited while saving.  
The progress while saving is displayed in r3996.

**Note:** Starting from the particular drive object, the following parameters are saved:  
CU3xx: Device-specific parameters and PROFIBUS device parameters.  
Other objects: Parameters of the actual object and PROFIBUS device parameters.  
Prerequisite:  
Before saving with p0971, all parameters (topology, all drive objects) must have been saved at least once using p0977 = 1.

<b>Value:</b>	0: Inactive 1: Hardware-Reset immediate 2: Hardware reset preparation 3: Hardware reset after cyclic communication has failed		
<b>Danger:</b>	It must be absolutely ensured that the system is in a safe condition. The memory card/device memory of the Control Unit must not be accessed.		
			
<b>Note:</b>	If value = 1: Reset is immediately executed and communications interrupted. After communications have been established, check the reset operation (refer below). This value cannot be set in operation. If value = 2: Help to check the reset operation. Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted. After communications have been established, check the reset operation (refer below). If value = 3: The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units. If cyclic communication is not active, then the reset is immediately executed. If the cyclic communication is active for both PROFIdrive interfaces, then the reset is executed after completing both cycle communications. After communications have been established, check the reset operation (refer below). To check the reset operation: After the drive unit has been restarted and communications have been established, read p0972 and check the following: p0972 = 0 --> the reset was successfully executed. p0972 > 0 --> the reset was not executed.

p0978[0...n]	List of drive objects / List of the DO		
CU_DC_S, CU_DC_R_S, CU_DC, CU_DC_R	<b>Can be changed:</b> C1(1) <b>Data type:</b> Unsigned8 <b>P group:</b> Topology <b>Not for motor type:</b> - <b>Min:</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 255	<b>Access level:</b> 2 <b>Function diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> [0] 1 [1...24] 0
<b>Description:</b>	<p>This parameter is an image of p0101 in conformance with PROFIdrive. Parameters p0101 and p0978 contain the following information: 1) The same number of drive objects 2) The same drive objects In this sense, they are consistent. Difference between p0101 and p0978: p0978 can be re-sorted and a zero inserted in order to identify those drive objects that participate in the process data exchange and to define their sequence in the process data exchange. Drive objects that are listed after the first zero, are excluded from the process data exchange. For p0978, in addition, the value 255 can be inserted a multiple number of times. p0978[n] = 255 means: The drive object is visible for the PROFIBUS master and is empty (without any actual process data exchange). This allows cyclic communications of a PROFIBUS master with unchanged configuring to the drive units with a lower number of drive objects.</p>		
<b>Dependency:</b>	See also: p0101, p0971, p0977		
<b>Note:</b>	p0978 cannot be changed when the drive system is first commissioned. The reason for this is that at this time the actual topology has still not been acknowledged (p0099 is still not equal to r0098 and p0009 is set to 0).

<b>Description:</b>	Sets the reference quantity for voltages. The reference quantity corresponds to 100% or 4000 hex (word) or 4000 0000 hex (double word).		
<b>Note:</b>	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity. Example: The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.

<b>Note:</b>	All referred current actual values refer to the rated device variables (rated armature current or rated field current). Reference current p2002 is only used as reference value, if a current actual value in amps is interconnected with a connector input, which expects a referred value (i.e. connector inputs with PERCENT or 4000H scaling). Example: CI: p2051 = r0027 (absolute current actual value smoothed [A])

<b>Description:</b>	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.		
<b>Value:</b>	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints		
<b>Recommendation:</b>	Do not change the setting p2037 = 0.		
<b>Note:</b>	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

<b>Description:</b>	Sets the delay time to initiate fault F01910 after a setpoint failure. The time until the fault is initiated can be used by the application. This means that it is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).

<b>Description:</b>	Sets the additional monitoring time to monitor the process data received via PROFIBUS. Enables short bus faults to be compensated. If no process data is received within this time, then an appropriate message is output.		
<b>Recommendation:</b>	In the isochronous mode, the additional monitoring time should not be set.		
<b>Note:</b>	For controller STOP, the additional monitoring time is not effective.

<b>Description:</b>	Sets the sampling time for the cyclic interface 1 (IF1).		
<b>Note:</b>	The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set. For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).

**Notice:** Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types.

A BICO interconnection for a single PZD can only take place either on r2050 or r2060.

**Description:** Status display for the PROFIBUS interface.

<b>Value:</b>	0: OFF 1: No connection (search for baud rate) 2: Connection OK (baud rate found) 3: Cyclic connection with master (data exchange) 4: Cyclic data OK
<b>Note:</b>	For r2054 = 2: If the state is not exited, then set or check the PROFIBUS address in p0918. For r2054 = 3: In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation: - no setpoints are being received as the PROFIBUS master is in the STOP condition. Only for isochronous operation, the following applies: - the drive is not in synchronism as the global control (GC) has an error. For r2054 = 4: In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free. This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.

For value = 1 (OFF1): Braking along the ramp-function generator down ramp followed by a pulse inhibit. For value = 2 (OFF2): Internal/external pulse inhibit. For value = 3 (OFF3): Braking along the OFF3 down ramp followed by a pulse inhibit. Parameter values designated as "reserved", act just like the value = 2 (OFF2)

## 2 Parameters

### 2.2 List of parameters

**Note:** The buffer parameters are cyclically updated in the background (refer to status signal in r2139).

Alarm buffer structure (general principle):

r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest)

...

r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest)

When the alarm buffer is full, the alarms that have gone are entered into the alarm history:

r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest)

...

r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

**Note:**

For bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. For this reason, the fault/alarm buffer should only be read if, after "Fault active" or "Alarm active" occurs, a change is also identified in the buffer (r0944, r9744, r2121).

For bit 06, 08:

These status bits are used for internal diagnostic purposes only.

For bit 12, 11:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with integrated SINAMICS functionality.

Bit	Signal name	1 signal	0 signal	FP
00	Ramp-up/down time independent of setpoint sign	Yes	No	-
01	Integrator independent of Kp	Yes	No	-
02	Output signal without ramp active	Yes	No	-
03	Actual value limit	Yes	No	-

**Dependency:**      See also: p2257, p2258, p2267, p2268, p2280, p2285

**Note:** For bit 00 = 0:  
The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle.

For bit 00 = 1:  
When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time.

For bit 01 = 0:  
The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time).

For bit 01 = 1:  
The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 > 0.

For bit 02 = 0:  
When the PID controller is deactivated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293.

For bit 02 = 1:  
When the PID controller is deactivated via p2200, the output signal r2294 is set directly to zero.

For bit 03 = 0:  
The actual values are not limited by p2267 and p2268.

For bit 03 = 1:  
The actual values are limited by p2267 and p2268.

<b>Value:</b>	0: No inversion 1: Inversion		
<b>Caution:</b>	If the actual value inversion is incorrectly selected, then the closed-loop control with the technology controller can become unstable and can oscillate!		
			
<b>Note:</b>	The correct setting can be determined as follows: - inhibit the technology controller (p2200 = 0). - increase the motor speed and in so doing, measure the actual value signal (of the technology controller). - if the actual value increases with increasing motor speed, then the inversion should be switched out. - if the actual value decreases with increasing motor speed, then the inversion should be set. If value = 0: The drive reduces the output speed when the actual value rises (e.g. for heating fans, intake pump, compressor). If value = 1: The drive increases the output speed when the actual value increases (e.g. for cooling fans, discharge pumps).

**Description:** Sets the operating mode for the "Hibernation mode" function.

**Value:**  
0: Hibernation mode inhibited  
1: Hibernation mode activated

**Dependency:** See also: p2200

**Caution:** When the "hibernation mode" function is active, the motor can start again automatically.

**Note:** When the "hibernation mode" function (p2398 = 1) is activated, its behavior is defined as to whether the technology controller is additionally switched in (closed-loop) or switched out (open-loop).

The technology controller is enabled via binector input p2200 and its mode is set in p2251.

p2200 = 0, p2251 = 0, 1:

Hibernation mode operates without technology controller (open-loop)

p2200 = 1, p2251 = 0:

Hibernation mode operates with technology controller (closed-loop)

p2200 = 1, p2251 = 1:

Hibernation mode operates without technology controller (open-loop) as its output is only used as supplementary setpoint and not as main setpoint.

<b>Description:</b>	Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.				
<b>Dependency:</b>	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).				
<b>Note:</b>	The resolution that is set must be able to be represented using r2723. For rotary axes/modulo axes, the following applies: This parameter is pre-set with p0421 when activating position tracking and can be changed. For linear axes, the following applies: This parameter is pre-assigned with p0421 when activating position tracking, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.

Difference outside the tolerance window --> An appropriate message is output.		
<b>Dependency:</b>	See also: F07449		
<b>Caution:</b>	Rotation, for example through a complete encoder range is not detected.		
			
<b>Note:</b>	The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

	15	Other faults	Yes	No	-

**Note:**

For bit 00:  
Hardware or software malfunction was identified. Carry out a POWER ON of the component involved. If it occurs again, contact Technical Support.

For bit 01:  
A line supply fault has occurred (phase failure, voltage level, ...). Check the line supply / fuses. Check the supply voltage. Check the wiring.

For bit 02:  
The DC link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.

For bit 03:  
An inadmissible operating state of the power electronics was identified (overcurrent, overtemperature, IGBT failure, ...). Check that the permissible load cycles are maintained. Check the ambient temperatures (fan).

For bit 04:  
The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet cooling.

For bit 05:  
A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.

For bit 06:  
The motor was operated outside the permissible limits (temperature, current, torque, ...). Check the load cycles and limits that have been set. Check the ambient temperature / motor cooling.

For bit 07:  
The communication to the higher-level control system (internal coupling, PROFIBUS, PROFINET, ...) is either faulted or interrupted. Check the state of the higher-level control system. Check the communication connection/wiring. Check the bus configuration / clock cycles.

For bit 08:  
A safety operation monitoring function (Safety) has detected an error.

For bit 09:  
When evaluating the encoder signals (track signals, zero marks, absolute values, ...) an illegal signal state was detected. Check the encoder / state of the encoder signals. Observe the maximum frequencies.

For bit 10:  
The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant design. Observe the maximum permissible quantity structure / clock cycles.

For bit 11:  
The infeed is faulted or has failed. Check the infeed and the surroundings (line supply, filter, reactors, fuses, ...). Check the closed-loop infeed control.

For bit 15:  
Group fault. Determine the precise cause of the fault using the commissioning tool.

<b>Description:</b>	Sets the signal source for the digital output DO 0 (X542.1, X542.2, X542.3) of Terminal Module 31 (TM31). Digital output 0 of TM31 is a relay output. If the signal at the binector input p4030 is low, then terminal COM 0 (X542.2) is connected to NC 0 (X542.1). This connection also matches the mechanical quiescent setting of the relay. If the signal at the binector input p4030 is high, then terminal COM 0 (X542.2) is connected to NO 0 (X542.3).

<b>Alarm:</b>	The maximum voltage difference between the analog input terminals AI+, AI- and the ground of the TM31 (X520.6, X530.3) may not exceed 35 V. 		
<b>Notice:</b>	For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 15 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.		
<b>Note:</b>	For operation as a voltage input/current input, switch S5.0 or S5.1 must be appropriately set. When changing p4056, the parameters of the scaling characteristic (p4057, p4058, p4059, p4060) are overwritten with the following default values: For p4056 = 0, 4, p4057 is set to 0.0 V, p4058 to 0.0 %, p4059 to 10.0 V and p4060 to 100.0 %. <b>Description:</b>	Setting to start the measurement of the wire resistance for a channel for the Terminal Module 150 (TM150). For a 2 wire evaluation, the total wire resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured wire resistance. Procedure: 1. Select the measuring method (1x2/2x2) for the corresponding terminal block (p4108[0...5] = 0, 1). 2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11). 3. Jumper the sensor to be connected (short-circuit the sensor cable close to the sensor). 4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-). 5. For the corresponding channel, start the measurement of the wire resistance (p4109[x] = 1). 6. After p4109[x] = 0, check the measured resistance value in p4110[x]. 7. Remove the jumper across the temperature sensor.

**Notice:** When forming groups, it must be ensured that in one particular group, only temperature channels with the following sensor types are included:  
 - "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6), real temperature actual value  
 or alternatively  
 - "PTC thermistor", "bimetallic NC contact" (p4100[0...11] = 1, 4), fictitious temperature actual value (-50 °C, 250 °C)  
 If these sensor types are combined within one group, then the calculated values for maximum, minimum and average value will be falsified.

**Note:** Active and inactive temperature channels can be included in one group. However, when calculating the values (r4112, r4113, r4114) only the active temperature channels with valid actual value are taken into account (r4105[0...11] not equal to -300 °C).

<b>Description:</b>	Sets the smoothing time constant for the 1st order lowpass filter of the temperature channels. The effective smoothing time constant depends on the number of channels that are simultaneously active and is displayed in r4120. In order that the value becomes effective, p4122 must be set $\geq 2 \cdot \text{channel sampling time}$ . The following applies: Channel sampling time = active number of channels * 50ms For lower values, a smoothing of $2 \cdot \text{channel sampling time}$ .

--	---	---	---

**Description:** Displays the trace buffer (record buffer) for trace 0 and signal 0.

The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks.

Example A:

The first 16384 values of signal 0, trace 0 are to be read out.

In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383].

Example B:

The values 16385 to 32768 from signal 0, trace 0 are to be read out.

In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

<b>Description:</b>	Displays the instant in time for fulfilling the trigger condition for trace recorder 0. The time comprises milliseconds (index 0) and days (index 1).		

<b>Index:</b>	[0] = Milliseconds [1] = Days
<b>Dependency:</b>	See also: r2114, r3102, r4719
<b>Notice:</b>	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a $\mu$ s accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. When referred to r4719, the trigger instant can therefore deviate somewhat.
<b>Note:</b>	If the time calculation of the drive can be synchronized with a higher-level control, then this time can be taken from the actual UTC time (r3102). Otherwise, the time is based on the system runtime (r2114).

<b>Description:</b>	Sets the scaling of the output signals for the free measurement function.		

## 2 Parameters

### 2.2 List of parameters

**Index:** [0] = Signal 1  
 [1] = Signal 2  
 [2] = Signal 3  
 [3] = Signal 4  
 [4] = Signal 5

**Note:** The parameter cannot be changed when the measurement function has been started (r4706 = 2, 3).

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 0
	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>
	0	4294967295	0

**Description:** Sets the number of cycles of a multiple trace.  
 The multiple trace is deactivated with a value = 0.  
 The multiple trace is permanently activated for a value >= 100000.

**Index:** [0] = Trace 0  
 [1] = Trace 1

**Dependency:** See also: r4841, p4844  
 See also: A02097, A02098

**Notice:** A multiple trace can have a negative impact on the total system performance.  
 From their inherent principle of operation, flash memory cards are subject to wear as a result of write operations. As a consequence, the lifetime of flash memory cards is reduced when using the multiple trace functionality.

**Note:** TEC: Technology Extension  
 The value in the error code must be interpreted in binary form. The bits have the following meaning:  
 Bit 00: Incompatible version of the TEC interface.  
 Bit 01: Technology Extension could not be loaded.  
 Bit 02: Incorrect description files.  
 Bit 03: Technology Extension does not define a CPU type.  
 Bit 04: Technology Extension for this device not available (incorrect CPU type).  
 Bit 05: Technology Extension for this device not available (incorrect type ID).  
 Bit 06: Incorrect description files (Const/Startup incompatible).  
 Bit 07: Number range of the Technology Extension overlaps with the number range of another Technology Extension  
 Bit 08: No compatible custom interface was found.  
 Bit 09: The custom interface defined by the Technology Extension already exists.  
 Bit 10: The version of the System Technology Extension differs from the SINAMICS firmware version.

## 2 Parameters

### 2.2 List of parameters

**Note:** KHP: Know-How Protection

For bit 00:  
Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:  
The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:  
If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:  
Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:  
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:  
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:  
When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:  
Together with p7755, the bit is used to monitor write protection.  
Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).  
Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

**Note:** KHP: Know-How Protection

For bit 00:  
Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:  
The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:  
If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:  
Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:  
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:  
When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:  
When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:  
Together with p7755, the bit is used to monitor write protection.  
Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).  
Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

<b>Dependency:</b>	See also: p7767, p7768			
<b>Notice:</b>	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. When using the STARTER commissioning tool, the password should be entered using the associated dialogs. The following rules apply when entering the password: - password entry must start with p7766[0]. - no gaps are permissible in the password. - entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

### 2.2 List of parameters

**Note:** KHP: Know-How Protection  
When reading, p7766[0...29] = 42 dec (ASCII character = "\*\*\*") is displayed.  
Parameters with the "KHP\_WRITE\_NO\_LOCK" attribute are not involved in the know-how protection.  
Parameters with the "KHP\_ACTIVE\_READ" attribute can be read even when know-how protection is activated.  
A product-specific list of these parameters is also available in the corresponding List Manual.

**Description:** Sets the reference serial number for the memory card.  
Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.  
**Dependency:** See also: p7765, p7766, p7767, p7768  
**Note:** KHP: Know-How Protection  
- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".  
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

<b>Description:</b>	Sets the action to be executed for NVRAM data. At the end of the action the value is automatically set to 0.			
<b>Value:</b>	0: Inactive 1: Load NVRAM data to parameters 2: Load parameters to NVRAM 3: Reset			
<b>Notice:</b>	After action p7770 = 1 no more pulses may be enabled. After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.			
<b>Note:</b>	If value = 1: This action loads the NVRAM data to the parameters. If value = 2: This action loads the parameters to the NVRAM. If value = 3: This action sets parameters p7771 ... p7774 to the factory setting. It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

<b>Description:</b>	Setting to backup/import/delete NVRAM data. NVRAM data are non-volatile data in the device (e.g. fault buffer). For NVRAM data actions, the following data are excluded: - crash diagnostics - CU operating hours counter - CU temperature - safety logbook			
<b>Value:</b>	0: Inactive 1: NVRAM data backup to memory card 2: Import NVRAM data from the memory card 3: Delete NVRAM data in the device 10: Error when clearing 11: Error when backing up, memory card not available 12: Error when backing up, insufficient memory space 13: Error when backing up 14: Error when importing, memory card not available 15: Error when importing, checksum error 16: Error when importing, no NVRAM data available 17: Error when importing			
<b>Notice:</b>	For value = 2, 3: These actions are only possible when pulses are inhibited.			
<b>Note:</b>	After the action has been successfully completed, the parameter is automatically set to zero. The actions importing and deleting NVRAM data immediately initiate a warm restart. If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

**Description:** Reference to the drive objects whose status has changed.  
Index 0:  
When changing one of the following indices, then the value in this index is increased.  
Index 1...n:  
The drive object with object number in p0101[n-1] has changed its status.  
Example:  
r7868[3] was incremented since the last time it was read.  
--> the status of the drive object with object number in p0101[2] was changed.

## 2 Parameters

### 2.2 List of parameters

**Note:**

For index [0]:  
When changing one of the following indices, then the value in this index is incremented.

For index [1]:  
Drive object commissioning: When changing p0010, p0107 or p0108, the value in this index is incremented.

For index [2]:  
Drive object name. When changing p0199, the value in this index is incremented.

For index [3]:  
Drive object structure. When changing a parameter that is relevant for the structure (e.g. number of data sets), the value in this index is incremented.

For index [4]:  
Drive object BICO interconnections. When changing r3977, the value in this index is incremented.

For index [5]:  
Drive object activity: When changing p0105, the value in this index is incremented.

For index [6]:  
Drive object, data save.  
0: There are no parameter changes to save.  
1: There are parameter changes to save.

For index [8]:  
Drive object changeover of units. When changing reference or changeover parameters (e.g. p2000, p0304), the value in this index is incremented.

For index [9]:  
Drive object parameter count. When changing the number of parameters by loading Drive Control Chart (DCC), the value in this index is incremented.

For index [10]:  
Drive object configuration. When changing either p0107 or p0108, the value in this index is incremented.

For index [12]:  
Drive object configuration. When activating/deactivating write protection or know-how protection, the value in this index is incremented.

---	---	--	---

**Description:** Project selection for SINAMICS Link.

**Value:**  
8: Project 8 participants, 32 words  
12: Project 12 participants, 24 words  
16: Project 16 participants, 16 words  
64: Project 64 participants, 16 words

**Note:** SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).  
The parameter must be set the same for all participants.  
A change only becomes effective after a POWER ON.  
The parameter is not influenced by setting the factory setting.

---	--	--	--

**Description:** Sets the clock cycle for SINAMICS Link.  
For index [0]:  
The isochronous mode cannot be activated for this Control Unit.  
0 = clock synchronous mode not activated, 1 = clock synchronous mode activated

For index [1]:  
Possible values: 500, 1000, 2000 µs

**Index:**  
[0] = Activate isochronous mode  
[1] = Bus CC [µs]

**Dependency:** See also: p8811

**Note:** SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).  
A change only becomes effective after a POWER ON.  
The parameter is not influenced by setting the factory setting.  
For index [0]:  
Is applicable for the synchronization of the application. The SINAMICS Link itself is always synchronous.  
For index [1]:  
The value must be set the same for all participants.  
When newly selecting the project p8811, p8812[1] is set to the factory setting.  
For p8811 = 8, 12, 16 the following applies:  
Min/max/factory setting: 500/500/500 µs  
For p8811 = 64, the following applies:  
Min/max/factory setting: 1000/2000/2000 µs

<b>Dependency:</b>	See also: p8811, p8835		
<b>Note:</b>	The maximum number of permitted participant addresses is limited by the project selection p8811. SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3). A change only becomes effective after a POWER ON. The parameter is not influenced by setting the factory setting.		

## 2 Parameters

### 2.2 List of parameters

<b>p8837</b>	<b>IF2 STW1.10 = 0 mode / IF2 STW1.10=0</b>		
DC_CTRL_S, DC_CTRL_R_S, DC_CTRL, DC_CTRL_R	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P group:</b> Communications <b>Not for motor type:</b> - <b>Min:</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 2	<b>Access level:</b> 3 <b>Function diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> 2
<b>Description:</b>	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.		
<b>Value:</b>	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints		
<b>Recommendation:</b>	Do not change the setting p2037 = 0.		
<b>Note:</b>	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.		
<hr/>			
<b>p8839[0...1]</b>	<b>PZD interface hardware assignment / PZD IF HW assign</b>		
CU_DC_S, CU_DC_R_S, CU_DC, CU_DC_R	<b>Can be changed:</b> C1(1) <b>Data type:</b> Integer16 <b>P group:</b> Communications <b>Not for motor type:</b> - <b>Min:</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 99	<b>Access level:</b> 3 <b>Function diagram:</b> 2197, 2198 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> 99
<b>Description:</b>	Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).		
<b>Value:</b>	0: Inactive 1: Control Unit onboard 2: COMM BOARD 99: Automatic		
<b>Index:</b>	[0] = Interface 1 [1] = Interface 2		
<b>Dependency:</b>	See also: p2030		
<b>Note:</b>	For value = 99 (automatic) the following applies: - if a COMM BOARD is not inserted, then the integrated communication interface (PROFIBUS/USS) communicates via IF1. - if a CBE20 is inserted, then PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2. For a value not equal to 99 (automatic) the following applies: - both indices must be set to a number not equal to 99 (automatic). A new setting only becomes effective after POWER ON, reset or download.		
<hr/>			
<b>p8840</b>	<b>COMM BOARD monitoring time / CB t_monit</b>		
CU_DC_S (PN CBE20), CU_DC_R_S (PN CBE20), CU_DC (PN CBE20), CU_DC_R (PN CBE20)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P group:</b> Communications <b>Not for motor type:</b> - <b>Min:</b> 0 [ms]	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 65535000 [ms]	<b>Access level:</b> 3 <b>Function diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> 20 [ms]
<b>Description:</b>	Sets the monitoring time to monitor the process data received via COMM BOARD. If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.		
<b>Dependency:</b>	See also: p8835		

**Note:** This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus.  
 For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4, 5).  
 For CBE20 firmware version Modbus TCP (p8835 =5) then the fieldbus data traffic is also monitored.  
 Value = 0: Monitoring is deactivated.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min:</b> 0	<b>Max:</b> 1	<b>Factory setting:</b> 0	
<b>Description:</b>	Activate a modified send configuration for COMM BOARD. With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.			
<b>Dependency:</b>	See also: p8841			
<b>Note:</b>	For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted. For CBE20, the parameter is only active for firmware selection "SINAMICS Link" (p8835 = 3).

## 2 Parameters

### 2.2 List of parameters

<b>Value:</b>	0: No initialization 1: Fatal fault 2: Initialization 3: Send configuration 4: Receive configuration 5: Non-cyclic communication 6: Cyclic communications but no setpoints (stop/no clock cycle) 255: Cyclic communication
<b>Note:</b>	For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3). For firmware version "PROFINET Device" or "EtherNet/IP" (p8835 = 1, 4), parameter p8956 should be observed.

## 2 Parameters

### 2.2 List of parameters

**Note:** For CBE20, the parameter is only valid for firmware version "PROFINET Device" (p8835 = 1), "EtherNet/IP" (p8835 = 4) or "MODBUS TCP" (p8835 = 5). Otherwise, it is locked.  
This restriction is not applicable for the CBE25.  
When a project is downloaded, the interface configuration is only activated if parameter p8945 is set = 1 or 2 in the offline project.  
For p8945 = 1:  
The interface configuration (p8940 and following) is activated.  
For p8945 = 2:  
The interface configuration (p8940 and following) is activated - and is saved in a non-volatile fashion (retentively).  
For p8945 = 3:  
All storage locations for the interface configuration are restored to the factory setting.  
The factory setting of the interface configuration is loaded when activated (p8945 = 1) or with the next POWER ON.

- topology error (incorrect port assignment).
- synchronization missing.

For EtherNet/IP, the following applies:

Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

<b>Description:</b>	Displays the statistics for the acyclic DRIVE-CLiQ communication of a component. The component is preset in p9221. The entry comprises the following elements: Index 0: Parameter Id. Index 1: Number of messages sent. Index 2: Minimum time of all acyclic tasks referred to parameter Id (index 0). Index 3: Maximum time of all acyclic requests referred to the parameter Id (index 0). Index 4: Average of all acyclic requests referred to the parameter Id (index 0). The time unit is 10 µs.		
<b>Dependency:</b>	The number of statistic entries is displayed in p9220. In p9221, the component Id can be set whose statistic is to be displayed. See also: r9220, p9221		
<b>Note:</b>	As a statistic entry comprises 5 data, when calling the entries via the terminal, a size that represents a multiple of 5 must be specified. Example: The 2nd entry should be called: rdp 1 9222 5 5 or rdpa 1 9222 5 5

<b>Description:</b>	Setting and display when memory card is "removed safely". Procedure: Setting p9400 = 2 results in a value of 3 --> The memory card can be removed safely. After removal the value sets itself to 0 automatically. Setting p9400 = 2 results in a value of 100 --> The memory card cannot be removed safely. Removal may destroy the file system on the memory card. It may be necessary to set p9400 = 2 again.		

<b>Value:</b>	0: No memory card inserted 1: Memory card inserted 2: Request "safe removal" of the memory card 3: "Safe removal" possible 100: "Safe removal" not possible due to access
<b>Dependency:</b>	See also: r9401
<b>Notice:</b>	Removing the memory card without a request (p9400 = 2) and confirmation (p9400 = 3) may destroy the file system on the memory card. The memory card will then no longer work properly and must be replaced.
<b>Note:</b>	The status when the memory card is being "removed safely" is shown in r9401. For value = 0, 1, 3, 100: These values can only be displayed, not set.

**Dependency:** See also: p9400

**Note:** For bit 01, 00:  
Bit 1/0 = 0/0: No memory card inserted (corresponds to p9400 = 0).  
Bit 1/0 = 0/1: "Safe removal" possible (corresponds to p9400 = 3).  
Bit 1/0 = 1/0: Status not possible.  
Bit 1/0 = 1/1: Memory card inserted (corresponds to p9400 = 1, 2, 100).  
For bit 02, 00:  
Bit 2/0 = 0/0: No memory card inserted.  
Bit 2/0 = 0/1: Memory card inserted, but not a SIEMENS memory card.  
Bit 2/0 = 1/0: Status not possible.  
Bit 2/0 = 1/1: SIEMENS memory card inserted.

**Description:** Displays the actual topology of the drive unit.  
The actual topology is sub-divided into several sections. Each of the following data is saved under an index.  
General data on the topology:  
- version  
- attribute to compare the actual topology and target topology  
- number of components  
Data on a component:  
- type component of the node ID of the component  
- number of DRIVE-CLiQ sockets in the Node Identifier  
- manufacturer and version of the Node Identifier  
- serial number of the Node Identifier (4 indices)  
- index of the component  
- article number (8 indices)  
- attribute to compare the actual topology and target topology of the component  
- communications address  
- number of port types  
- port type  
- number of ports of the port type  
- communications address of the associated/linked component  
- number of the associated/linked port  
- communications address of the associated/linked component  
- number of the associated port, etc.  
Data on the next component:

## 2 Parameters

### 2.2 List of parameters

**Note:** The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Article No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Article Number

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

<b>p9909</b>	<b>Topology comparison component replacement / Topo_cmpr replace</b>		
CU_DC_S, CU_DC_R_S, CU_DC, CU_DC_R	<b>Can be changed:</b> C1(1) <b>Data type:</b> Unsigned8 <b>P group:</b> Topology <b>Not for motor type:</b> - <b>Min:</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max:</b> 1	<b>Access level:</b> 3 <b>Function diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting:</b> 1
<b>Description:</b>	For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion. For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned: - component type (e.g. "SMC20") - article number (e.g. "6SL3055-0AA0-5BA0") For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.		
<b>Dependency:</b>	See also: p9904, p9905		
<b>Note:</b>	The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON). ### Description:

- o0.0 No torque direction switched on
- o0.1 Torque direction I switched on
- o0.2 Torque direction II switched on
- o0.9 Wait for enable from master
- o1.0 Wait time for brake opening time running
- o1.1 Wait for operating enable at terminal 13
- o1.2 Wait for operating enable (signal source according to p0852) - or for the "Close brake" command to be withdrawn (signal source according to p0858)
- o1.3 Wait time running after withdrawing an OFF command (jogging, OFF1, OFF3)
- o1.4 Wait for field reversal to be implemented or for "Braking by field reversal" to be withdrawn
- o1.5 Wait for operating enable from the optimization run
- o1.6 Wait for withdrawal of the immediate pulse inhibit (signal source acc. to p50177)
- o1.7 Wait until SINAMICS DCMs connected in parallel are in status o0
- o1.8 Wait until the power unit topology has been switched over
- o2.0 Wait for setpoint  $|r52193| \geq p50091[1]$
- o3.0 Wait for the thyristor check to be completed
- o3.1 Wait for the line symmetry check to be completed
- o3.2 Wait for a DC contactor to pick up
- o3.3 Wait for the feedback signal, "Line contactor" (signal source acc. to p50691)
- o4.0 Wait for voltage at power connections 1U1, 1V1, 1W1
- o4.1 Wait for fuse monitoring to signal OK
- o4.5 Wait for precharging of the CCP's chopper capacitors to be completed
- o5.0 Wait until the field current actual value r52265 is  $> p50396$  and until "I\_field ext  $> I_{f\_min}$ " (see p50265)
- o5.1 Wait for voltage at power connections 3U1, 3W1

#### Note:

A specific time, which can be set in p50089, represents the maximum wait time in states o4 and o5 combined. If, after this time, the relevant conditions have still not been met, the corresponding error message will be triggered.

- o6.0 Wait for the auxiliaries to power up (wait time p50093)
- o6.1 Wait for a setpoint  $\leq p50091[0]$  at RFG input (p52193)
- o7.0 Wait for switch-on via terminal 12
- o7.1 Wait for switch-on (signal source according to p0840)
- o7.2 Wait for the "Braking by field reversal" command to be withdrawn
- o7.3 Wait for parallel master to switch on
- o7.4 Optimization run executes pre-work/post-work
- o7.5 Wait until the SINAMICS DCM devices connected in parallel are ready to be switched on
- o7.6 Wait for "Load MLFB" to be completed (carried out by manufacturer prior to delivery)
- o8.0 Wait for closing lockout to be acknowledged
- o8.1 Simulation mode active (see p51840)
- o9.1 Quick stop (OFF3) (signal source acc. to p0848) present
- o9.2 Quick stop (OFF3) (signal source acc. to p0849) present
- o10.1 Voltage disconnect (OFF2) (signal source acc. to p0844) pending
- o10.2 Voltage disconnect (OFF2) (signal source acc. to p0845) pending
- o10.3 E stop (safety shutdown) (terminal 105/106) pending
- o10.6 CUD right

The temperature sensor is connected via terminal X177.53/54/55 of the CUD.

**Dependency:**

The temperature value is only displayed when using one of the following temperature sensors:  
 - KTY84 (p50490 = 1): measuring range = -40 °C to +300 °C  
 - PT100 (p50490 = 6): measuring range = -200 °C to +300 °C  
 - NTC thermistor K227 (p50490 = 7): measuring range = +85 °C to +200 °C  
 - PT1000 (p50490 = 8): measuring range = -200 °C to +300 °C  
 See also: p50490, r52051

**Note:**

If p50490 = 0, 2 to 5, a value of 0 is displayed.

<b>Description:</b>	Sets the response for I2t monitoring of the power unit.		
<b>Value:</b>	0: Dynamic overload not permitted 1: Dynamic overload possible, A60039 2: Dynamic overload possible, F60139		
<b>Note:</b>	If value = 0: Dynamic overload capability is not permissible. The armature current setpoint (r52133) is limited to $p50077 * r50072[1]$ . A value of 0 can only be set, if $p50067 = 1$ . If value = 1: Dynamic overload capability is permissible. As long as the calculated temperature rise of the thyristors does not exceed the permissible value, the armature current setpoint is limited to the value $p50077 * r50072[1] * 180\%$ . If the permissible value is exceeded, the device will protect itself by reducing the current limit to $p50077 * r50072[1]$ . Alarm A60039 is triggered at the same time. The armature current setpoint limit will only be increased back to the value $p50077 * r50072[1] * 180\%$ and alarm A60039 will only disappear once the calculated temperature rise of the thyristors falls back below the permissible value and the armature current setpoint is less than the device rated current $r50072[1]$ . If value = 2: Dynamic overload capability is permissible. If the calculated temperature rise of the thyristors exceeds the permissible value, the drive will be shut down with fault F60139.

<b>Description:</b>	Sets the reduction of the device rated direct current for armature and field. The device rated direct current is reduced to the value set here to better adapt the device to the motor.		
<b>Index:</b>	[0] = Armature [1] = Field		
<b>Note:</b>	- If a load class has been set in parameter p50067 which reduces the device rated direct current, the smaller of the two values will be applied. - The value set in index 0 (armature) results in a hardware-based adaption of the current actual value sensing gain. This can only be adapted in a discrete stages. As a consequence, the value set here is not precisely effective, but the next possible value. The actually effective rated device current can be seen in parameter r50072[1]. <b>Notice:</b>	Although it is permissible for the parameter to be changed to values not equal to 0 in operating states o1.0, such changes will not be applied until operating states greater than or equal to o7.0.		
<b>Note:</b>	If an external field device is used, the setpoint comes from r52268 (e.g. via an analog output or over the peer-to-peer interface). The rated direct current of the external field device should be set in p51838. This value is also displayed in r50073[1]. p50076[2] is redundant. If the external field device sends a field current actual value signal, this should be fed in via p50612. If the external field device is not able to send a field current actual value signal, p50263 should be set to a value of 1 or 2. If the external field device sends an I <sub>field</sub> < I <sub>field_min</sub> signal, this can be fed in at injection point p50265. If p50082 = 0: - No field is used (e.g. in the case of permanent-magnet motors). The field firing pulses are disabled. The motor flux is set to the value for 100% rated flux. If p50082 = 1: - Internal field power unit. The line supplies for the field and armature sections are connected or disconnected simultaneously. The field firing pulses are enabled/disabled at the same time as the line contactor closes/opens; the field current decays with the field time constant during freewheeling. If p50082 = 2: - Internal field power unit. Automatic injection of standstill field set in p50257 after expiry of a period of time set in p50258 once operating state o7 or higher has been reached. If p50082 = 3: - Internal field power unit. The field is active continuously. If p50082 = 4: - Internal field power unit. The field is switched together with the Auxiliaries ON signal (p53210.2). If p50082 = 21: - External field device. The field is controlled in the same way as with p50082 = 1. If p50082 = 22: - External field device. The field is controlled in the same way as with p50082 = 2. If p50082 = 23: - External field device. The field is controlled in the same way as with p50082 = 3. 	<b>Min:</b> -10.00 [s]	<b>Max:</b> 10.00 [s]	<b>Factory setting:</b> 0.00 [s]

**Description:** Sets the brake opening time  
When "Open brake" is sent, the firing pulse enable is delayed by this time.

**Note:** For a negative time setting:  
With "Open brake", a delay corresponding to the set time is applied in relation to the enable for the firing pulses for the thyristors. During this time, the motor works in opposition to the brake, which is still closed. This is useful, for example, in the cases of suspended loads.

For a positive time setting:  
When the "Switch on", "Jog" or "Creep" command is sent with operation enabled, the firing pulses for the thyristors are not enabled until the set time has elapsed. During this time, the drive is in operating state o1.0 to give a holding brake the opportunity to open in advance.

<b>Description:</b>	Sets the wait time for voltage and field current at the power unit. Once the line contactor has dropped out and the "Switch on", "Jog" or "Creep" commands have been sent, in operating states o4 and o5, the drive waits for voltage at the power unit and for a field current actual value (r52265) > 50% of the field current setpoint (r52268). If, during this time, no voltage is detected at the power unit and the field current is missing, a message is output accordingly.

<b>Index:</b>	[0] = Field decay [1] = Control new field contactor [2] = Enable field firing pulses [3] = After field build up before armature enable		
<b>Dependency:</b>	See also: p50580, p50581, p50583, r53195		

**Note:** For index [0]:  
 Wait time for the field to decay before opening the actual field contactor.  
 When initiating an operation to reverse the field, after reaching  $I_{\text{Field}} (r52265) < I_{\text{Field\_min}} (p50394)$ , this wait time expires before the actual field contactor is opened.

For index [1]:  
 Wait time before controlling the new field contactor.  
 After the actual field contactor has opened, this wait time expires before the field contactor is controlled for the "new" field direction (the dropout delay time of the contactor used is generally higher than the closing delay time).

For index [2]:  
 Wait time before enabling the field firing pulses.  
 After controlling the field contactor for the "new" field direction, this wait time expires before the field firing pulses are enabled. This time must be greater than the closing delay time of the contactor being used.

For index [3]:  
 Wait time after the field has been re-established before the armature is enabled.  
 After the field firing pulses have been enabled, the field current actual value  $I_{\text{field}}$  in the "new" field direction reaches the value  $I_{\text{field}} (r52265) > I_{\text{field\_set}} (r52268) * p50398/100\%$ . This wait time then starts to run. After this expires, the internal (armature) "operating enable for field reversal" is issued, and the drive is no longer held in operating state o1.4.  
 After the field current has been re-established, this wait time allows the system to wait for the overshoot of the field current actual value to end and therefore the overshoot of the EMF of the DC motor before armature operation is enabled. This is intended to avoid armature overcurrents due to an excessively high EMF during an overshoot.

## 2 Parameters

### 2.2 List of parameters

**Notice:** If the motor is connected to the DC current output (terminal 1C1, 1D1) via a contactor, then generally, this contactor is also controlled from the relay for the line contactor (terminals 109, 110). In this case, it must be ensured that the firing pulses are only enabled after it is completely certain that the contactor has closed. To realize this, this additional wait time is required when switching on.

**Note:** If the function "Feedback line contactor" is used, a change to 1 signal must be detected via p50691 within the time set in p50095. Otherwise, state o3.3 is kept until this time elapses and afterwards fault F60104 is triggered with fault value 6.

	<b>Min:</b> 0.1 [A]	<b>Max:</b> 20000.0 [A]	<b>Factory setting:</b> 0.1 [A]
<b>Description:</b>	Sets armature current I2 according to the motor's nameplate for "speed-dependent current limitation". The characteristic for "speed-dependent current limitation" is defined by 2 pairs of values (p50104/p50105, p50106/p50107). This parameter sets armature current I2 for the 2nd pair of values (p50106/p50107).

## 2 Parameters

### 2.2 List of parameters

**Note:** If value = 0:  
The integrator is only effective after a change in torque direction (only functions as a ramp-function generator for the current setpoint until the 1st time the output reaches the setpoint at the integrator input after a change in torque direction).  
If value = 1:  
The integrator is always effective (functions as a ramp-function generator for the current setpoint).

<b>Description:</b>	Sets the additional Alpha W pulses with inhibited second pulse in the auto-reversing stage.		
<b>Recommendation:</b>	This parameter should be set to values > 0 in particular when supplying high inductances (e.g. infeed of solenoids).		
<b>Dependency:</b>	See also: p50179		

**Note:** Number of additional Alpha W pulses with disabled second pulse following detection of  $I = 0$  signal prior to a change in torque direction.

These pulses cause the current to decay prior to a change in torque direction.

When it drops below the thyristor holding current value, the current is suddenly chopped by the unfired second thyristor and the residual energy stored in the load inductance must be dissipated via a protective circuit (e.g. a varistor) to prevent the load inductance from producing an overvoltage.

	<b>Min:</b> -	<b>Max:</b> -	<b>Factory setting:</b> 1

**Description:** Sets the signal source for the "No immediate pulse inhibit" command.

A low signal will cause the armature firing pulses to be inhibited immediately without waiting for the I = 0 signal or sending Alpha W pulses for current decay. The additional Alpha W pulses (as set in p50161 and p50179) are not output either. As long as this command is pending, it will not be possible to switch to an operating state lower than o1.6.

**Note:** This command can be used, for example, if the drive is being used to supply a field rather than a motor and the current is to be reduced via an external built-on field discharge resistor connected in parallel.

	<b>Min:</b> -	<b>Max:</b> -	<b>Factory setting:</b> 0

**Description:** Sets the signal source for the "Fire all thyristors simultaneously" command.

The default setting of this command (high signal) causes all 6 thyristors on thyristor bridge I to be fired continuously and simultaneously. Changeover to long pulses is automatic.

**Note:** However, this command is only active if no line voltage is applied to the armature power unit.

**Description:** Sets the additional Alpha W pulses with enabled second pulse in the auto-reversing stage.

**Recommendation:** This parameter should be set to values > 0 in particular when supplying high inductances (e.g. infeed of solenoids).

## 2 Parameters

### 2.2 List of parameters

**Note:** Number of additional Alpha W pulses with enabled second pulse following detection of I = 0 signal prior to a change in torque direction.

These pulses cause the current to decay before a change in torque direction; the thyristors are fired in pairs to prevent sudden chopping and the generation of overvoltage by the load inductance when the current drops below the thyristor holding current.

When a change in torque direction is required, the current in the existing direction must be reduced.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 0.000	<b>Max:</b> 10.000	<b>Factory setting:</b> 0.000
<b>Description:</b>	Sets the y coordinate for pair of values 2 for adaptation of the droop.		

---

**Notice:**

- For the droop, generally values up to 10 % are practical (p50227 = 0.000 ... 0.100). Under certain circumstances, higher values can result in an unstable response of the speed controller.
- The droop is entered as absolute factor without any dimensions and it is especially important to note that it is not a percentage.

Example:

Set droop = 5 % --> p50227 = 0.05

**Note:** The adaptation of the droop is defined using 2 pairs of values.

Pair of values 1:

p50558/p50552 (x/y coordinate)

Pair of values 2:

p50561/p50227 (x/y coordinate)

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 0	<b>Max:</b> 1	<b>Factory setting:</b> 0
<b>Description:</b>	Setting for the control of the integral component tracking on the speed controller.		
<b>Value:</b>	0: Tracking ON 1: Tracking OFF		
<b>Dependency:</b>	See also: p50084, p50687		
<b>Note:</b>	p50229 = 0: Tracking of the integral component on the speed controller activated. The speed actual value is used as speed setpoint and the integral component of the speed controller is tracked so that r52148 = r52140 results. p50229 = 1: Tracking of the integral component on the speed controller de-activated.		

---

<b>p50230[0...n]</b>	<b>Set speed controller integral component duration / Set I_comp dur</b>		
DC_CTRL	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2
	<b>Data type:</b> FloatingPoint32	<b>Dyn. index:</b> DDS, p0180	<b>Function diagram:</b> 6815
	<b>P group:</b> -	<b>Unit group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 0 [ms]	<b>Max:</b> 10000 [ms]	<b>Factory setting:</b> 0 [ms]
<b>Description:</b>	Sets the duration for setting the integral component on the speed controller. Following a positive edge on binector input p50695, the integral component of the speed controller is set to the value of the signal source set at connector input p50631. If p50230 = 0: The integral component of the speed controller is set to the instantaneous value of the signal present at connector input p50631. If p50230 > 0: The integral component of the speed controller is tracked continuously during the time set to the value of the signal present at connector input p50631.

	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>
	10 [%]	100 [%]	75 [%]
<b>Description:</b>	Sets the dynamic response of the speed control circuit as the default for the speed controller optimization run.		
<b>Recommendation:</b>	On drives with gear backlash, for example, optimization should be started commencing with low dynamic response values at and above 10%. Values of up to 100 % can be selected for drives with the highest demands placed on synchronous operation and dynamic performance.		
<b>Note:</b>	If this value is changed, the optimization run for the speed controller will have to be performed again before the new value is applied.		
<b>p50237[0...n]</b>	<b>Speed controller reference model natural frequency / n_ctrl ref_m fn</b>		
DC_CTRL	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 2

	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>
	0.0 [Hz]	150.0 [Hz]	0.0 [Hz]
<b>Description:</b>	Sets the natural frequency of a PT2 element for the reference model of the speed controller.		
<b>Recommendation:</b>	The reference model is correctly set when the characteristics of r52154 (reference model output) and r52167 (actual speed value) are virtually identical when the I component of the speed controller is disabled.		

**Dependency:** In conjunction with p50238 and p50239, the characteristics (in time) of the P-controlled speed control loop can be emulated.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 0.00	<b>Max:</b> 2.00	<b>Factory setting:</b> 0.00
<b>Description:</b>	Sets the "fractional" dead time for the reference model of the speed controller. This parameter emulates the computing dead time of the proportionally controlled speed control loop. The multiplier set refers to the speed controller clock cycle.		
<b>Recommendation:</b>	The reference model is correctly set when the characteristics of r52154 (reference model output) and r52167 (actual speed value) are virtually identical when the I component of the speed controller is disabled.		
<b>Dependency:</b>	In conjunction with p50237 and p50238, the characteristics (in time) of the P-controlled speed control loop can be emulated. See also: p50237, p50238

	<b>Min:</b> 0 [°]	<b>Max:</b> 180 [°]	<b>Factory setting:</b> 0 [°]

**Description:** Sets the rectifier stability limit for the firing angle of the field converter.

**Dependency:** See also: r53191

**Note:** The status of the Alpha G limit is shown in r53191.1.

---

#### p50251[0...n] Field converter Alpha W limit / Field Alpha W lim

DC_CTRL	<b>Can be changed:</b> U, T	<b>Calculated:</b> -	<b>Access level:</b> 3

#### p50252[0...n] Field average number of line periods / Field line per no.

DC_CTRL	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> Unsigned16	<b>Dyn. index:</b> DDS, p0180	<b>Function diagram:</b> 6952
	<b>P group:</b> -	<b>Unit group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 1	<b>Max:</b> 20	<b>Factory setting:</b> 20

**Description:** Setting of the number of line periods for line frequency correction in the field circuit.

**Note:** The internal line synchronization for the field firing pulses derived from the power terminals (line infeed) is averaged over the number of line periods set in this parameter.

In the case of operation on "weak" power supplies with unstable frequencies (on a diesel-driven generator, for example (isolated operation)), this parameter must be set lower than for operation on "constant V/Hz" systems to achieve a higher frequency correction speed.

<b>Value:</b>	0: Field current controller actual value (r52265) 1: EMF pre-control output (r52293 or r52268) 2: Field current controller setpoint (r52268)		

**Note:** If value = 0:  
This setting is recommended for a fully compensated DC motor.  
If value = 1:  
This setting is recommended for an uncompensated DC motor. The EMF controller must be active for this setting (the EMF controller compensates the armature reaction).  
If value = 2:  
This setting is recommended for a fully compensated DC motor.  
Advantage compared with value = 0:  
Values derived from the setpoint are generally steadier than those derived from the actual value.  
Disadvantage compared with value = 0:  
The actual value can deviate from the setpoint dramatically, thereby distorting the motor flux calculation.

<b>Description:</b>	Sets the operating mode for the "Freeze field current setpoint" function.		
<b>Value:</b>	0: Never freeze 1: Freeze for tachometer breakage 2: Freeze for every fault		
<b>Notice:</b>	For settings 0 and 1, when a fault message occurs, the EMF control remains active. Even if the speed sensing is faulted or if the contactor on the DC side is open. In these cases, the EMF controller cannot prevent overvoltages occurring at the motor. As a consequence, measures must be ensured on the system side that ensure that the motor is not damaged by overvoltages.

## 2 Parameters

### 2.2 List of parameters

**Note:** If p50302 = 0:  
- The parameter sets are not changed over and ramp-function generator setting 1 is always used (or the setting made using p50637, p50638).  
If p50302 = 1:  
- Once the setpoint has been reached for the first time, the ramp-function generator parameter set is changed over from 1 to 0.  
If p50302 = 2:  
- Once the setpoint has been reached for the first time, the ramp-function generator parameter set is changed over from 1 to 2.  
If p50302 = 3:  
- Once the setpoint has been reached for the first time, the ramp-function generator parameter set is changed over from 1 to 3.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b> 0 [ms]	<b>Max:</b> 60000 [ms]	<b>Factory setting:</b> 0 [ms]
<b>Description:</b>	Sets the delay time for undervoltage detection in the context of line monitoring.		
<b>Note:</b>	This time starts when undervoltage is detected. While this delay time is running, firing pulses are emitted; at the end of this time, fault F60006 is triggered. If a time has been set for automatic restart (p50086), it will not begin until the time set here has elapsed.

<b>Description:</b>	Sets the threshold for detecting that the line frequency has been undershot.		
<b>Dependency:</b>	See also: F60008		
<b>Note:</b>	If the line frequency undershoots the value set here and does not rise back above it within the restart time set in p50086, fault F60008 is triggered. All the while the line frequency remains lower than the value set here, the drive is kept in operating state "o4".

<b>Description:</b>	Sets the threshold for detecting that the line frequency has been overshot.		
<b>Dependency:</b>	See also: F60009		
<b>Caution:</b>	 SINAMICS DCM DC converters are suitable for line frequencies from 50 Hz up to 60 Hz (rated value). Restricted operation in the extended frequency range (20 Hz to 500 Hz) is possible on request. If a SINAMICS DCM DC converter is continuously operated in the extended frequency range, then it would be damaged or destroyed as a result of overheating. The SINAMICS DCM Control Module is suitable for line frequencies from 20 Hz up to 500 Hz if it is operated with a power unit designed for this frequency range.		
<b>Note:</b>	If the line frequency overshoots the value set here and does not fall back below it within the restart time set in p50086, fault F60009 is triggered. All the while the line frequency remains higher than the value set here, the drive is kept in operating state "o4".

**Description:** Sets the factor for the setpoint for the "Field current actual value less than setpoint" message.

**Dependency:** See also: p50399, r53026

**Note:** This threshold also affects the phase logic execution in the context of the Direction reversal by field reversal and Braking by field reversal functions.

The "Field current actual value less than setpoint" message is displayed via r53026.1.

<b>Dependency:</b>	See also: r50012, r52051 See also: F60029, A60032		
<b>Note:</b>	Comments regarding PTC thermistors: - PTC thermistors according to DIN 44081 / 44082 with the specified R for the rated response temperature. - For Siemens motors, PTC thermistors with 1330 Ohm are used. - Parameters p50491 and p50492 (alarm and switch-off temperature) are ineffective. The alarm and switch-off temperatures are defined by the PTC thermistor type being used. Comments on NTC thermistor K227: The evaluation electronics on the CUD only allow resistance values of less than approx. 2 kOhm to be measured. As a consequence, only temperatures greater than approx. 90 °C can be measured when using these temperature sensors. For lower temperatures, the lowest possible value (approx. 90 °C) is displayed.

<b>Description:</b>	Sets friction compensation at 0% speed.		
<b>Recommendation:</b>	In the case of operation in both directions of rotation, this basic value should be set to 0% to prevent the armature current from oscillating.		
<b>Note:</b>	The basic values are based on the device rated direct current or the device rated torque. The basic values for friction compensation (p50520 ... p50530) are set automatically during the optimization run for friction compensation (p50051 = 28). There is linear interpolation between the basic values; here, the friction compensation value takes on the input signal's sign.

<b>Description:</b>	Sets the acceleration time on the speed controller.		
<b>Dependency:</b>	See also: r52150, r52174		
<b>Note:</b>	The acceleration time is the time which would be needed to accelerate the drive from 0 to 100% of the maximum speed at 100% device rated current (with no friction present). It is a measure of the moment of inertia at the motor shaft. The acceleration time is set automatically during the optimization run for the speed controller (p50051 = 26).		

<b>p50541[0...3]</b>	<b>Speed controller setpoint/actual value difference factor / Set/act dif fact</b>

<b>Description:</b>	Sets the factor for the acceleration on the speed controller, which is dependent upon the difference between the setpoint and the actual value. In the case of the "Acceleration dependent upon setpoint/actual value difference" function, only the proportion of the speed controller's setpoint/actual value difference which has an absolute value in excess of the threshold (p50543) is switched through.

<b>Description:</b>	Sets the dt for the output of dy/dt in r52191. The change in the ramp-function generator's output variable (p52190) in relation to the time set in p50542 is output in r52191.		
<b>Dependency:</b>	See also: p50330, r52191		
<b>Note:</b>	Example: A ramp-up time of 5 s is set on the ramp-function generator; in other words, a complete ramp-up from y = 0% to 100% will take 5 s. A time difference dt of 2 s is set in p50542. This results in a dy/dt of 40% at r52191, since the set dt of 2s produces a dy of $(2 \text{ s} / 5 \text{ s}) * 100\% = 40\%$ .

<b>Description:</b>	Sets the y coordinate for pair of values 1 for adaptation of the droop.		
<b>Notice:</b>	- For the droop, generally values up to 10 % are practical (p50552 = 0.000 ... 0.100). Under certain circumstances, higher values can result in an unstable response of the speed controller. - The droop is entered as absolute factor without any dimensions and it is especially important to note that it is not a percentage. Example: Set droop = 5 % --> p50552 = 0.05		
<b>Note:</b>	This droop is effective up to x coordinate 1 (p50558). The adaptation of the droop is defined using 2 pairs of values. Pair of values 1: p50558/p50552 (x/y coordinate) Pair of values 2: p50561/p50227 (x/y coordinate)

**Description:** Sets the signal source for the setpoint on the armature current controller.

**Notice:** For index [5]:  
When entering a supplementary current setpoint via p50601[5] it is not permissible to use the current setpoint integrator or the reduced gearbox load function. p50158 must be set = 0.000 s.  
Possible effect if this is not observed:  
Torque direction change will not be able to be completed. The drive remains in one torque direction.

## 2 Parameters

### 2.2 List of parameters

**Note:** For index [0...1]:  
Speed limiting controller  
Sets the signal sources for the setpoint on the speed limiting controller. The two values are added together.

For index [2...3]:  
Current limiting  
Sets the signal sources for the setpoint on the current controller (before current limitation). The two values are added together.

For index [4...5]:  
Current control  
Sets the signal sources for the setpoint on the current controller (before the current controller). The two values are added together. The absolute value is generated from the value in index 5.

#### p50797 P2P IF telegram monitoring time / P2P t\_telegr mon

DC_CTRL	<b>Can be changed:</b> T	<b>Calculated:</b> -	<b>Access level:</b> 2

	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>
	0.000 [s]	65.000 [s]	0.000 [s]

**Description:** Sets the telegram monitoring time for the peer-to-peer interface (P2P IF).

The time set is only effective in "Peer-to-peer interface" operating mode (p50790 = 5).

p50797 = 0:  
Monitoring is deactivated.

p50797 > 0:  
Monitoring is activated.

As well as one valid telegram being received, the next valid telegram must be received within the set time. Otherwise, fault F60012 is triggered.

**Dependency:** See also: F60012

**Note:** Telegram monitoring is activated in the following cases:

- From receipt of the first error-free telegram
- After switching on of the electronics power supply
- From receipt of the first error-free telegram after telegram monitoring has responded (i.e. telegram monitoring timeout).

The telegram monitoring time (p50797) depends on the baud rate set (p50793) The following minimum setting values are recommended for safe operation:

- 300 baud --> p50797 = 0.520 s (recommended minimum value)
- 600 baud --> p50797 = 0.260 s (recommended minimum value)
- 1200 baud --> p50797 = 0.140 s (recommended minimum value)
- 2400 baud --> p50797 = 0.080 s (recommended minimum value)
- 4800 baud --> p50797 = 0.040 s (recommended minimum value)

If the "Automatic restart" function (p50086 > 0) has been selected on the peer-to-peer communication partner, only a parameter setting p50797 > p50086 (on the communication partner) will be meaningful.

- [6] = Number of block check errors
- [7] = Number of break errors
- [8] = Number of timeout errors

**Note:** The fault frequency is recorded with free-running counters; when a counter reaches 65535 it is reset to 0.

The diagnostic information in indexes 5, 6 and 8 is irrelevant for communication with SIMOREG CCP (p50790 = 6).

Possible causes for STX errors:

- Non-observance of start interval before STX
- STX incorrect, i.e. not equal to 02

Possible causes for timeout errors:

- Telegram monitoring timeout (p50797)

Value = 1:

The thyristors are tested when first switching on or jogging after the electronics power supply has been switched on.

Value = 2:

The thyristors are tested at each switch-on or jogging.

Value = 3:

The thyristors are tested at the next switch-on or jogging. p50830 is set to 0 if the test was completed error-free.

**Value:**

0: Switched off

1: After the first ON command

2: After each ON command

3: After next ON command

**Dependency:**

See also: F60061

**Note:**

The thyristor test function cannot be used when supplying extremely high inductances (e.g. when supplying a field from armature terminals, supplying solenoids, etc.) and must be de-activated (p50830 = 0).

When SINAMICS DCM are connected in parallel (6 pulse or 12 pulse), thyristor diagnostics may only be selected at the master. The thyristor diagnostics is then first carried out at the master, and then automatically at all of the slaves one after the other. If a defective thyristor is detected at a SINAMICS DCM, then the corresponding fault message is initiated at this SINAMICS DCM and not at the master where thyristor diagnostics was started.

### 2.2 List of parameters

<b>Index:</b>	[0] = Speed setpoint processing (FP3105 to FP3135) [1] = RFG (FP3150 to FP3155) [2] = Closed-loop speed control (FP6800 to FP6820) [3] = Torque limiting/Current limitation (FP6825 to FP6845, FP8040) [4] = Closed-loop armature current control (FP6852 to FP6855) [5] = EMF setpoint processing and closed-loop control (FP6900) [6] = Closed-loop field current control (FP6905 to FP6910)
<b>Note:</b>	This parameter is only evaluated once while powering up, i.e. a change only becomes effective after a new start or after powering up with saved parameters (p0976 = 11).  The ability to de-activate control function blocks has been designed for users who set up their own control configurations using Drive Control Chart (DCC) (e.g. synchronous generator field winding instead of running a motor). De-activating control function blocks which are not needed frees up CPU time for the DCC blocks.

**Description:** Response of the fan control:  
0: The fan control takes into account the temperature sensor.  
1: The fan control does not take into account the temperature sensor.

**Value:** 0: The fan control takes into account the temperature sensor.  
1: The fan control doesn't take into account the temperature sensor

**Dependency:** See also: r50960, p50961

**Note:** Setting 1:  
The fan is only switched off after the parameterized fan run-on time, independent of the various temperature measurements and independent of the calculated thyristor temperature rise (=barrier layer temperature of the thyristors).  
As a consequence, it is also possible to acknowledge a fan fault even at ambient temperatures > 35°.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>
	0	1	1

**Description:** Sets the synchronizing voltage type when used as three-phase AC power controller.

**Value:**  
 0: Synchronization voltage internal  
 1: Synchronizing voltage external

**Dependency:** See also: p51400, p51406

- Note:**
- The parameter is only active, if p51400 is set > 0 (used as three-phase AC power controller).
  - The phase-to-phase voltage U-V must always be sensed as synchronizing voltage.
  - A clockwise phase sequence must always be used when connecting the power.
  - For p51405 = 0, the internal synchronizing voltage is used. An external potential transformer is not required.
  - A setting value of 0 is only permissible for DCM Control Modules or for devices with option L30.
  - Siemens must always be contacted regarding the availability of devices with option L30 (DCM with three-phase controller power unit) before ordering.
  - The parameter only becomes active the next time that the electronics power supply is switched-off/switched-on.

**Description:** Sets the criterion to detect a commutation failure for the commutation monitoring. 3 decision criteria are available in order to identify commutation failure. For test purposes, these criteria can be individually set using these parameters.

Bit array:	Bit	Signal name	1 signal	0 signal	FP
	00	Criterion 1 (signal from thyristor blocking voltage)	Yes	No	6865
	01	Criterion 2 (curvature of the current cusp)	Yes	No	6865
	02	Criterion 3 (amplitude of the current actual value)	Yes	No	6865

**Dependency:** See also: p50166

See also: F60300

**Note:** The converter commutation is continuously monitored. If a commutation fault is detected, fault F60300 is initiated and thyristor turn-off is initiated by the CCP (if available).  
For bit 00:  
This criterion is only effective if the thyristor blocking voltage calculation has also been activated (p50166= 1).  
For bit 01:  
This criterion results in two checks being made:  
1) After each firing pulse, the system checks as to whether the current has actually commutated in the fired thyristor pair.  
This check is only performed if the natural firing sequence was previously maintained 6 times one after the other.  
This check is not made for a 6 pulse parallel connection.  
2) The curvature of the current cusps is checked.  
This check is not made for a 12 pulse series connection.

**Value:**  
0: No turn-off command  
1: Issue in torque direction I  
2: Issue in torque direction II

**Notice:** After a turn-off command is issued to the CCP, this parameter automatically returns to the value 0.

## 2 Parameters

### 2.2 List of parameters

**Note:** If the test command is issued in operation (i.e. in operating state o0.1 or o0.2), then the turn-off operation of the SIMOREG CCP acts on the thyristor bridge that is presently enabled. This is independent of whether the turn-off command is issued in torque direction I or II.

	<b>Min:</b> 0.000 [s]	<b>Max:</b> 60.000 [s]	<b>Factory setting:</b> 0.000 [s]
<b>Description:</b>	All fault responses are not immediately initiated, but only after a parameterizable delay time. For a description of the fault responses, see the parameter description for parameter p2101.		
<b>Danger:</b>	When using the parameter, the fault responses of ALL fault messages are involved. Take into account the behavior when considering the safety situation in your plant or system. If in any doubt, leave the parameter at 0.		
 <b>Caution:</b>	If the cause of the fault message disappears during the delay time, the fault response is still realized after this time expires.		
	If the cause of the fault message disappears during the delay time, and is acknowledged before the delay time expires, the fault message disappears, and a fault response is not initiated.		
<b>Note:</b>	Active faults are signaled at r2139.3 and r3114.10.

## 2 Parameters

### 2.2 List of parameters

**Note:** If value = 0:  
The parallel connection interface is inactive, the hardware does not have to be connected. The power unit operates alone.  
If value = 1:  
a) Several converters are connected with one another via the parallel interface. The power units operate independently of one another. Data exchange via the parallel interface is only used to exchange BICO signals.  
b) At a CUD in the right-hand slot, a value of 1 must always be set.  
For values > 1:  
Several converters are connected with one another via the parallel interface. The power units are also connected with one another and operate together (series connection, parallel connection). Data exchange via the parallel interface allows the power units to operate together and is additionally used to exchange BICO signals.

<b>Note:</b>	For a 6-pulse parallel connection (p51800 = 11, 12 or 13) and activated redundant operation (p51803 = 1), then the power units may fail (e.g. go into a fault condition). In this operating mode, using this parameter, the minimum number of power units must be set which must be ready for operation. In this case, the total number of converters should be set at p51812. In all other cases, the number of power units that operate together must be precisely set.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min:</b>	<b>Max:</b>	<b>Factory setting:</b>
	1	16	1

**Description:** Sets the number of CUDs, which communicate with one another via the parallel switching interface. This setting is intended so that every device connected to the parallel switching interface can monitor whether all devices are active and/or available. Each of the devices connected to the parallel switching interface continually monitors whether all of the devices regularly send telegrams. "Device connected to the parallel switching interface" is every CUD, at which p51800 > 0. "Regularly sending telegrams" means that the time between two send telegrams from the same device must be less than 100 ms.

**Note:**

- If the number set here is less than the actual number of devices connected to the parallel switching interface, then failure of some of the devices is ignored until the number of devices set using this parameter is fallen below.
- A setting of 1 means that the monitoring is inactive.

**Description:** Sets the sensor type for the temperature sensors on the Control Module.

**Value:** 0: No temperature sensor present  
1: NTC with 6.8 kOhm  
2: NTC with 10 kOhm

**Index:** [0] = Temperature sensor 1 / XT5 / A7109  
[1] = Temperature sensor 2 / XT6 / A7109  
[2] = Temperature sensor 3 / XT7 / A7116

**Dependency:** See also: p51829  
See also: F60067

**Note:** The NTC temperature sensor should be connected at module A7109 or A7116 at terminal XT5, XT6 or XT7.  
The parameter is only effective on the Control Module.

**Dependency:** See also: F60004, F60204

**Note:** The parameter is only effective on the Control Module.

Connector X23B is available on the power interface and on the expansion module (A7112 module). Monitoring at connectors X23C to X23F is only possible using the expansion module.

Only groups of up to 6 inputs can be activated and de-activated at the same time.

If an expansion module is connected to slot X23A, slot X23B cannot be used on the power interface.

The following list contains the parameters that are dependent on the command data sets.

Product: SINAMICS DC MASTER, Version: 5104032, Language: eng, Type: CDS

p0700[0...n]	Macro Binector Input (BI) / Macro BI
p0820[0...n]	BI: Drive Data Set selection DDS bit 0 / DDS select., bit 0
p0821[0...n]	BI: Drive Data Set selection DDS bit 1 / DDS select., bit 1
p0840[0...n]	BI: ON / OFF (OFF1) / ON / OFF (OFF1)
p0844[0...n]	BI: No coast-down / coast-down (OFF2) signal source 1 / OFF2 S_src 1
p0845[0...n]	BI: No coast-down / coast-down (OFF2) signal source 2 / OFF2 S_src 2
p0848[0...n]	BI: No Quick Stop / Quick Stop (OFF3) signal source 1 / OFF3 S_src 1
p0849[0...n]	BI: No Quick Stop / Quick Stop (OFF3) signal source 2 / OFF3 S_src 2
p0852[0...n]	BI: Enable operation/inhibit operation / Enable operation
p0854[0...n]	BI: Control by PLC/no control by PLC / Master ctrl by PLC
p0855[0...n]	BI: Unconditionally release holding brake / Uncond open brake
p0856[0...n]	BI: Enable speed controller / n_ctrl enable
p0858[0...n]	BI: Unconditionally close holding brake / Uncond close brake
p1000[0...n]	Macro Connector Inputs (CI) for speed setpoints / Macro CI n_set
p1035[0...n]	BI: Motorized potentiometer setpoint raise / Mop raise
p1036[0...n]	BI: Motorized potentiometer lower setpoint / Mop lower
p1055[0...n]	BI: Jog bit 0 / Jog bit 0
p1056[0...n]	BI: Jog bit 1 / Jog bit 1
p1070[0...n]	CI: Main setpoint / Main setpoint
p1113[0...n]	BI: Setpoint inversion / Setp inv
p1140[0...n]	BI: Enable ramp-function generator/inhibit ramp-function generator / Enable RFG
p1141[0...n]	BI: Continue ramp-function generator/freeze ramp-function generator / Continue RFG
p1142[0...n]	BI: Enable setpoint/inhibit setpoint / Setpoint enable
p1500[0...n]	Macro Connector Inputs (CI) for torque setpoints / Macro CI M_set
p2103[0...n]	BI: 1st acknowledge faults / 1st acknowledge
p2104[0...n]	BI: 2nd acknowledge faults / 2nd acknowledge
p2105[0...n]	BI: 3rd acknowledge faults / 3rd acknowledge
p2106[0...n]	BI: External fault 1 / External fault 1
p2107[0...n]	BI: External fault 2 / External fault 2
p2108[0...n]	BI: External fault 3 / External fault 3

The following list contains the parameters that are dependent on the encoder data sets.

Product: SINAMICS DC MASTER, Version: 5104032, Language: eng, Type: EDS

p0141[0...n]	Encoder interface (Sensor Module) component number / Enc_interf comp_no
p0142[0...n]	Encoder component number / Encoder comp_no
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0145[0...n]	Activate/deactivate encoder interface / Enc_intf act/deact
r0146[0...n]	Encoder interface active/inactive / Enc_intf act/inact
r0147[0...n]	Sensor Module EEPROM data version / SM EEPROM version
r0148[0...n]	Sensor Module firmware version / SM FW version
p0400[0...n]	Encoder type selection / Enc_typ sel
p0401[0...n]	Encoder type OEM selection / Enc type OEM sel
p0402[0...n]	Gearbox type selection / Gearbox type sel
p0404[0...n]	Encoder configuration effective / Enc_config eff
p0405[0...n]	Square-wave encoder track A/B / Sq-wave enc A/B
p0407[0...n]	Linear encoder grid division / Enc grid div
p0408[0...n]	Rotary encoder pulse number / Rot enc pulse No.
p0410[0...n]	Encoder inversion actual value / Enc inv act value
p0411[0...n]	Measuring gear configuration / Meas gear config
p0412[0...n]	Measuring gear absolute encoder rotary revolutions virtual / Abs rot rev
p0413[0...n]	Measuring gear position tracking tolerance window / Pos track window
p0414[0...n]	Redundant coarse position value relevant bits (identified) / Relevant bits
p0415[0...n]	Gx_XIST1 Coarse position safe most significant bit (identified) / Gx_XIST1 safe MSB
p0416[0...n]	Non safety-relevant meas. steps position value POS1 (detected) / nsrPos1
p0417[0...n]	Encoder safety comparison algorithm (detected) / Safety comp_algo
p0418[0...n]	Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1
p0419[0...n]	Fine resolution absolute value Gx_XIST2 (in bits) / Enc fine Gx_XIST2
p0420[0...n]	Encoder connection / Enc_connection
p0421[0...n]	Absolute encoder rotary multiturn resolution / Enc abs multiturn
p0422[0...n]	Absolute encoder linear measuring step resolution / Enc abs meas step
p0423[0...n]	Absolute encoder rotary singleturn resolution / Enc abs singleturn
p0424[0...n]	Encoder linear zero mark distance / Enc lin ZM_dist
p0425[0...n]	Encoder rotary zero mark distance / Enc rot dist ZM
p0426[0...n]	Encoder zero mark differential distance / Enc ZM Dif_dist
p0427[0...n]	Encoder SSI baud rate / Enc SSI baud rate
p0428[0...n]	Encoder SSI monoflop time / Enc SSI t_monoflop
p0429[0...n]	Encoder SSI configuration / Enc SSI config
p0430[0...n]	Sensor Module configuration / SM config
p0431[0...n]	Angular commutation offset / Ang_com offset
p0432[0...n]	Gearbox factor encoder revolutions / Grbx_fact enc_rev
p0433[0...n]	Gearbox factor motor/load revolutions / Grbx_fact mot_rev
p0434[0...n]	Encoder SSI error bit / Enc SSI error bit
p0435[0...n]	Encoder SSI alarm bit / Enc SSI alarm bit
p0436[0...n]	Encoder SSI parity bit / Enc SSI parity bit
p0437[0...n]	Sensor Module configuration extended / SM config ext
p0438[0...n]	Squarewave encoder filter time / Enc t_filt
p0439[0...n]	Encoder ramp-up time / Enc ramp-up time
p0440[0...n]	Copy encoder serial number / Copy enc ser_no
p0441[0...n]	Encoder commissioning serial number part 1 / Enc comm ser_no 1
p0442[0...n]	Encoder commissioning serial number part 2 / Enc comm ser_no 2
p0443[0...n]	Encoder commissioning serial number part 3 / Enc comm ser_no 3
p0444[0...n]	Encoder commissioning serial number part 4 / Enc comm ser_no 4
p0445[0...n]	Encoder commissioning serial number part 5 / Enc comm ser_no 5
p0453[0...n]	Pulse encoder evaluation zero speed measuring time / Enc_ev n_0 t_meas
p0454[0...n]	Sensor Module configuration extended Part 2 / SM config ext 2
p4630[0...n]	Absolute encoder linear measuring step factor / Abs_enc meas fact
p4649[0...n]	Encoder function reserve amplitude limit incremental signals / Enc fct amp inc

p4678[0...n]	Analog sensor LVDT ratio / An_sens LVDT ratio
p4679[0...n]	Analog sensor LVDT phase / An_sens LVDT ph
p4680[0...n]	Zero mark monitoring tolerance permissible / ZM_monit tol perm
p4681[0...n]	Zero mark monitoring tolerance window limit 1 positive / ZM tol lim 1 pos
p4682[0...n]	Zero mark monitoring tolerance window limit 1 negative / ZM tol lim 1 neg
p4683[0...n]	Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos
p4684[0...n]	Zero mark monitoring tolerance window alarm threshold negative / ZM tol A_thr neg
p4685[0...n]	Speed actual value mean value generation / n_act mean val
p4686[0...n]	Zero mark minimum length / ZM min length

## 2.4 Parameters for write protection and know-how protection

### 2.4.1 Parameters with "WRITE\_NO\_LOCK"

The following list contains the parameters with the "WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS DC MASTER, Version: 5104032, Language: eng, Type: WRITE\_NO\_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev comm par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p4700[0...1]	Trace control / Trace control
p4701	Measuring function control / Meas fct ctrl
p4703[0...1]	Trace options / Trace options
p4707	Measurement function configuration / Meas fct config
p4710[0...1]	Trace trigger condition / Trace Trig_cond
p4711[0...5]	Trace trigger signal / Trace trig_signal
p4712[0...1]	Trace trigger threshold / Trace trig_thresh
p4713[0...1]	Trace tolerance band trigger threshold 1 / Trace trig thr 1
p4714[0...1]	Trace tolerance band trigger threshold 2 / Trace trig thr 2
p4715[0...1]	Trace bit mask trigger, bit mask / Trace trig mask
p4716[0...1]	Trace bit mask trigger trigger condition / Trace Trig_cond
p4720[0...1]	Trace recording cycle / Trace record_cyc
p4721[0...1]	Trace recording time / Trace record_time
p4722[0...1]	Trace trigger delay / Trace trig_delay
p4723[0...1]	Trace time slice cycle / Trace cycle
p4724[0...1]	Trace average in the time range / Trace average
p4730[0...5]	Trace record signal 0 / Trace record sig 0
p4731[0...5]	Trace record signal 1 / Trace record sig 1
p4732[0...5]	Trace record signal 2 / Trace record sig 2
p4733[0...5]	Trace record signal 3 / Trace record sig 3
p4734[0...5]	Trace record signal 4 / Trace record sig 4
p4735[0...5]	Trace record signal 5 / Trace record sig 5
p4736[0...5]	Trace record signal 6 / Trace record sig 6
p4737[0...5]	Trace record signal 7 / Trace record sig 7
p4780[0...1]	Trace physical address signal 0 / Trace PhyAddr Sig0
p4781[0...1]	Trace physical address signal 1 / Trace PhyAddr Sig1
p4782[0...1]	Trace physical address signal 2 / Trace PhyAddr Sig2

## 2.4 Parameters for write protection and know-how protection

p4783[0...1]	Trace physical address signal 3 / Trace PhyAddr Sig3
p4784[0...1]	Trace physical address signal 4 / Trace PhyAddr Sig4
p4785[0...1]	Trace physical address signal 5 / Trace PhyAddr Sig5
p4786[0...1]	Trace physical address signal 6 / Trace PhyAddr Sig6
p4787[0...1]	Trace physical address signal 7 / Trace PhyAddr Sig7
p4789[0...1]	Trace physical address trigger signal / Trace PhyAddr Trig
p4795	Trace memory bank changeover / Trace mem changeov
p4800	Function generator control / FG control
p4810	Function generator mode / FG operating mode
p4812	Function generator physical address / FG phys address
p4813	Function generator physical address reference value / FG phys addr ref
p4816	Function generator output signal integer number scaling / FG outp integ scal
p4819	BI: Function generator control / FG control
p4820	Function generator signal shape / FG signal shape
p4821	Function generator period / FG period duration
p4822	Function generator pulse width / FG pulse width
p4823	Function generator bandwidth / FG bandwidth
p4824	Function generator amplitude / FG amplitude
p4825	Function generator 2nd amplitude / FG 2nd amplitude
p4826	Function generator offset / FG offset
p4827	Function generator ramp-up time to offset / FG ramp-up offset
p4828	Function generator lower limit / FG lower limit
p4829	Function generator upper limit / FG upper limit
p4830	Function generator time slice cycle / FG time slice
p4831	Function generator amplitude scaling / FG amplitude scal
p4832[0...2]	Function generator amplitude scaling / FG amplitude scal
p4833[0...2]	Function generator offset scaling / FG offset scal
p4835[0...4]	Function generator free measurement function scaling / FG fr MeasFct scal
p4840[0...1]	MTrace cycle number setting / Cycle number
p7761	Write protection / Write protection
p7770	NVRAM action / NVRAM action
p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3
p9210	Flashing component number / Flash comp_no.
p9211	Flash function / Flash fct.
p9400	Safely remove memory card / Mem_card rem
p9484	BICO interconnections search signal source / BICO S_src srch

## 2.4.2 Parameters with "KHP\_WRITE\_NO\_LOCK"

The following list contains the parameters with the "KHP\_WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the know-how protection.

Product: SINAMICS DC MASTER, Version: 5104032, Language: eng, Type: KHP_WRITE_NO_LOCK	
p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev comm par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0154	Terminal Module detection via LED / TM detection LED

p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2040	Fieldbus interface monitoring time / Fieldbus t_monit
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p7761	Write protection / Write protection
p7770	NVRAM action / NVRAM action
p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8835	CBE20 firmware selection / CBE20 FW sel
p8839[0...1]	PZD interface hardware assignment / PZD IF HW assign
p8840	COMM BOARD monitoring time / CB t_monit
p9210	Flashing component number / Flash comp_no.
p9211	Flash function / Flash fct.
p9400	Safely remove memory card / Mem_card rem
p9484	BICO interconnections search signal source / BICO S_src srch

#### 2.4.3 Parameters with "KHP\_ACTIVE\_READ"

The following list contains the parameters with the "KHP\_ACTIVE\_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS DC MASTER, Version: 5104032, Language: eng, Type: KHP\_ACTIVE\_READ

p0015	Macro drive unit / Macro drv unit

<b>Data sets</b>		<b>Information on parameters, binectors, connectors</b>					
Symbol	Meaning	Symbol	Meaning				
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).	Parameter name	Parameter name (up to 18 characters).				
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).	[Unit]	[dimension unit] rotatory axis, for linear axis see list of parameters.				
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).	rxxx[y] or rxxx[y...z] or rxxx[y].ww or rxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "[y]" specifies the valid index, "[y...z]" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).	pxxxx[y] or pxxxx[y...z] or pxxxx[y].ww or pxxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "[y]" specifies the applicable index, "[y...z]" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).	from ... to	Value range.				
		(xxxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.				
		(Def)	Factory setting.				
		(Def.w)	Factory setting with bit number as prefix.				
		[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]				
		<b>Samplings times</b>					
		Symbol	Meaning				
		pxxxx[Y] (ZZZ.ZZ µs)	Setting parameter with factory setting to select the time slice.				
		p0115[y] (Drive Object)	Time slice depending on the pre-setting p0112 of the drive object. "[y]" specifies the applicable index.				
		p0115[y] (Motor Modules)	Time slice depending on the rated pulse frequency of the motor module. "[y]" specifies the applicable index.				
		PROFIdrive sampling time	Pre-setting for IF1 in p2048. Pre-setting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.				
		CAN bus sampling time	Pre-setting in p8848.				
		Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.				
		Not relevant	A static state is displayed here. The sampling time data is not relevant.

**Handling BICO technology**

**Binector:**  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

**Connector:**  Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

**Parameterization:**

At the signal destination, the required binector or connector is selected using appropriate parameters:  
 "Bl:" parameter for binectors (Bl = Binector Input)  
 or  
 "Cl:" parameter for connectors (Cl = Connector Input)

**Example:**

The main setpoint for the speed controller (Cl: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (Bl: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

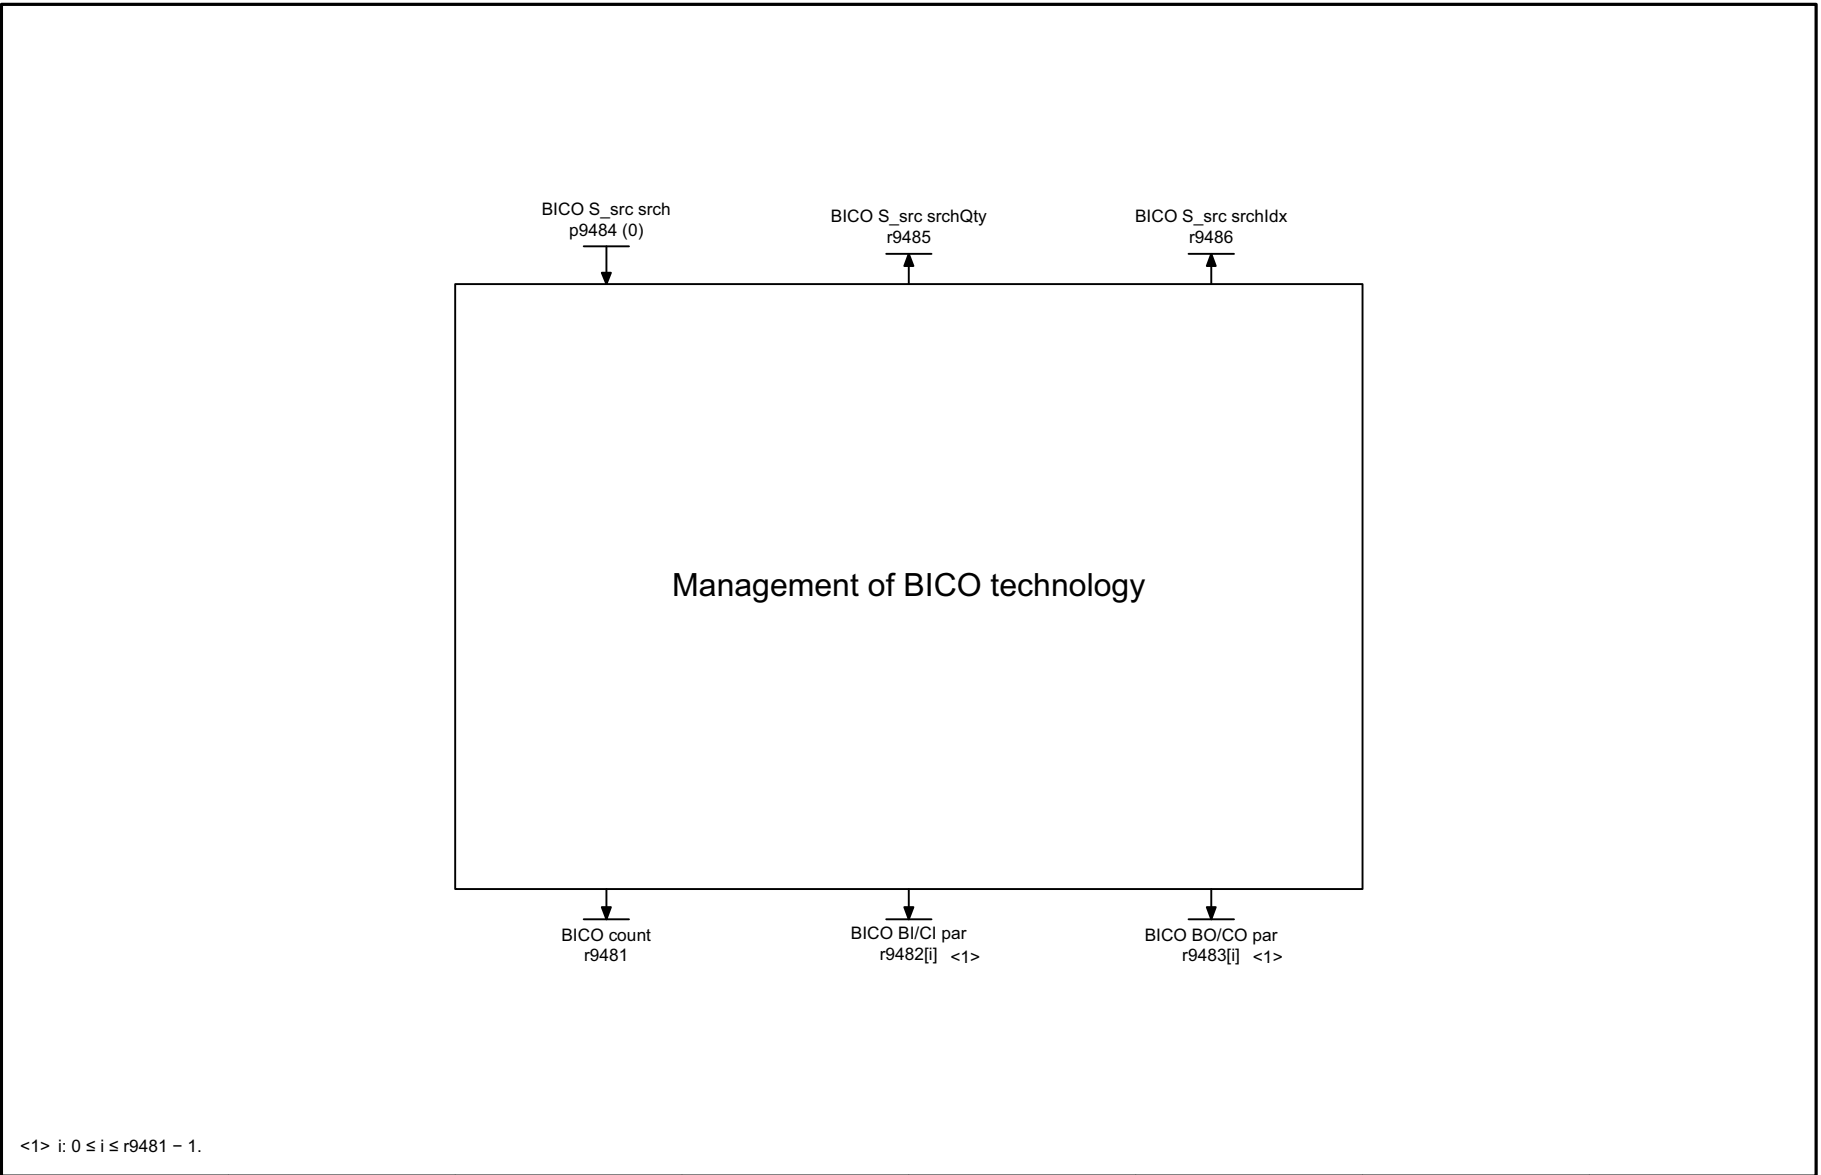

**Parameterizing steps:**

- ① p1055[0] = r0722.0 Terminal X122.1 acts as "Jog bit 0".
- ② p1070[0] = r1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

## The most important control blocks can be activated/deactivated using parameter p50899.

**Note 1:**

This parameter is evaluated only once during a ramp-up, meaning that a change only becomes effective after a POWER ON or after a ramp-up with saved parameters (p0976 = 11).

**Note 2:**

The ability to deactivate control function blocks is intended for all users who wish to configure their own control system using Drive Control Chart (DCC), e.g. because they are using the SINAMICS DC MASTER to operate something other than a motor (such as the excitation winding of a synchronous generator).

Deactivating control function blocks that are not required frees up CPU time for the DCC function blocks.

Parameter	Meaning	
p50899[0]	Speed setpoint processing ([3105] ... [3135])	<1>
p50899[1]	Ramp-function generator ([3150] ... [3155])	
p50899[2]	Speed control ([6800] ... [6820])	<2>
p50899[3]	Torque limitation/current limitation ([6825] ... [6845], [8040])	
p50899[4]	Armature current control ([6852] ... [6855])	
p50899[5]	EMF setpoint processing and EMF control ([6900])	
p50899[6]	Field current control ([6905] ... [6910])	

<1> Exception [3130]:

The switch-on command and the intervention of r0807.0 and r53010.2 are always active.

<2> Exception [6810]:

The "Selection of the actual speed value" is always active.

p50899[0...6] = 0: Block is deactivated

p50899[0...6] = 1: Block is activated

- <1> A PZD send word can either be supplied via connector input p8851[x] (WORD) or via p8861[x] (DWORD). The two corresponding connector inputs cannot be interconnected.
- <2> The following representation applies: For words 4000 hex = 100 % resp. for double words 4000 0000 hex = 100 %. For further interconnecting the reference quantities of the interconnected connector inputs are relevant.
  - For DC\_CTRL (SINAMICS DCM) is valid:  
Interconnecting to connector inputs with scaling "PERCENT" is recommended.  
For physical quantities the reference values p200x are valid (100 % corresponds to p200x).  
For speed values is valid: Depending on the setting of p50083[D], further reference quantities must be set, see [6810.3], [2075.2].  
Current and torque are related to motor or device.
  - For DCP\_CTRL (SINAMICS DCP) is valid:  
For physical quantities the reference values r5007x are valid (100 % corresponds to r5007x).  
The following applies for temperature values: 100 °C corresponds to 100 % = 4000 hex or 4000 0000 hex; 0 °C corresponds to 0 %.
- <3> To comply with the PROFIdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.
- <4> Using the binector/connector converters at [2489], bits of 5 send words can be interconnected with any binectors.

**Execution of an optimization run:**

- 1) Select the requested optimization run in p50051.
- 2) Switch on drive (OFF1 0 →1; not for p50051 = 30).
- 3) Wait until optimization run has ended (drive switches to state o8 automatically).  
For p50051 = 30 applies: drive switches back in the same state as before starting the optimization run.

## 4.1 Overview of faults and alarms

### 4.1.1 General information on faults and alarms

#### Display of faults/alarms

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

The following methods are available for displaying faults and alarms:

- Display via the fault and alarm buffer for PROFIBUS.
- Display via the commissioning software in online operation.

#### Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault response is triggered.</li> <li>• Status signal ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults eliminated?</p> <ul style="list-style-type: none"> <li>• Remove the original cause of the fault.</li> <li>• Acknowledge the fault.</li> </ul>
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status signal ZSW1.7 is set.</li> <li>• The alarm is entered into the alarm buffer.</li> </ul> <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.</li> </ul>

## Fault reactions

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	No response when a fault occurs.
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p><b>Closed-loop speed control (p50084 = 1)</b></p> <ul style="list-style-type: none"> <li>n_set = 0 is input immediately to brake the drive along the ramp-function generator down ramp.</li> <li>When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the closing time (p50088) expires.</li> </ul> <p>Zero speed is detected when the actual speed value falls below the speed threshold (p50370).</p> <p><b>Closed-loop torque control (p50084 = 2)</b></p> <ul style="list-style-type: none"> <li>The following applies for closed-loop torque control: Reaction as for OFF2.</li> </ul>
OFF2	COAST STOP	Internal/external pulse disable	<p><b>Closed-loop speed and torque control</b></p> <ul style="list-style-type: none"> <li>Instantaneous pulse suppression, the drive “coasts” to a standstill.</li> <li>Switching-on inhibited is activated.</li> </ul>
OFF3	QUICK STOP	Brake along the OFF3 down ramp followed by pulse inhibit	<p><b>Closed-loop speed control (p50084 = 1)</b></p> <ul style="list-style-type: none"> <li>n_set = 0 is input immediately to brake the drive along the OFF3 down ramp (p50296).</li> <li>When zero speed is detected, the motor holding brake (if parameterized) is closed. ### Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been eliminated.

Table 4-3 Acknowledging faults

Acknowledgment	Description
POWER ON	<p>The fault is acknowledged by a POWER ON (switch drive unit off and on again).</p> <p><b>Note:</b> If this action has not removed the fault cause, the fault is displayed again immediately after power up.</p>
IMMEDIATELY	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Set acknowledgment by parameter: p3981 = 0 --&gt; 1</p> <p>2 Acknowledging via binector inputs:</p> <p>p2103            BI: 1. Acknowledge faults p2104            BI: 2. Acknowledge faults p2105            BI: 3. Acknowledge faults</p> <p>3 Acknowledging via a PROFIdrive control signal: STW1.7 = 0 --&gt; 1 (edge)</p> <p>4 Acknowledge all faults</p> <p>p2102            BI: Acknowledge all faults</p> <p>All of the faults on all of the drive objects of the drive system can be acknowledged using this binector input.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• These faults can also be acknowledged by a POWER ON operation.</li> <li>• If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment.</li> </ul>
PULSE SUPPRESSION	<p>The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0). The same options are available for acknowledging as described under acknowledge IMMEDIATELY.</p>

### Fault buffer - saved when switching off

The contents of the fault buffer are saved to non-volatile memory when the Control Unit is powered down, i.e. the fault buffer history is still available when the unit is powered up again.

The fault buffer of a drive object comprises the following parameters:

- r0945[0...63], r0947[0...63], r0948[0...63], r0949[0...63]
- r2109[0...63], r2130[0...63], r2133[0...63], r2136[0...63]

The fault buffer contents can be deleted manually as follows:

- Delete fault buffer for all drive objects:  
p2147 = 1 --> p2147 = 0 is automatically set after execution.
- Delete fault buffer for a specific drive object:  
p0952 = 0 --> The parameter belongs to the specified drive object.

The fault buffer contents are automatically deleted when the following occurs:

- Restore factory setting (p0009 = 30 and p0976 = 1).
- Download with modified structure (e.g. number of drive objects changed).
- Power-up after other parameter values have been loaded (e.g. p0976 = 10).
- Upgrade firmware to later version.

### 4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms (Page 927)" has the following layout:

----- **Start of example** -----

---

<b>Axxxxx (F, N)</b>	<b>Fault location (optional): Name</b>
<b>Message value:</b>	Component number: %1, fault cause: %2
<b>Message class:</b>	Text of the message class (number according to PROFIdrive)
<b>Drive object:</b>	List of objects.
<b>Reaction:</b>	NONE
<b>Acknowledgment:</b>	NONE
<b>Cause:</b>	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).
<b>Remedy:</b>	Description of possible remedies.
Reaction to F:	NO (OFF1, OFF2, OFF3)
Acknowledgment for F:	IMMEDIATELY (POWER ON)
Reaction to N:	NONE
Acknowledgment for N:	NONE

----- **End of example** -----

<b>Axxxxx</b>	<b>Alarm xxxxx</b>
<b>Axxxxx (F, N)</b>	<b>Alarm xxxxx (message type can be changed in F or N)</b>
<b>Fxxxxx</b>	<b>Fault xxxxx</b>
<b>Fxxxxx (A, N)</b>	<b>Fault xxxxx (message type can be changed in A or N)</b>
<b>Nxxxxx</b>	<b>No message</b>
<b>Nxxxxx (A)</b>	<b>No message (message type can be changed in A)</b>

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No report" or "Internal report"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

---

**Note:**

You can change the default properties of a fault or alarm by setting parameters.

References: SINAMICS DC MASTER operating instructions

The "List of faults and alarms (Page 927)" supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

---

**Fault location (optional): Name**

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

**Message value:**

The information provided under the message value informs you about the composition of the fault/alarm value.

**Example:**

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

**Message class:**

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 922)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
  - Specifies the "Channel error type" of the PROFINET channel diagnostics.
  - When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
  - Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.
  - When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
  - Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
  - When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

## 4 Faults and alarms

### 4.1 Overview of faults and alarms

- ET 200 (dec)

Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.

When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.

- NAMUR (r3113.x)

Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Table 4-4 Message classes and coding of various diagnostic interfaces

Text of the message class (number according to PROFIdrive) Cause and remedy.	Diagnostics interface				
	PN (hex)	DS1 (dec)	DP (dec)	ET 200 (dec)	NAMUR (r3113.x)
<b>Hardware/software errors (1)</b> A hardware or software malfunction was detected. Carry out a POWER ON for the relevant component. If it occurs again, contact the hotline.	9000	0	16	9	0
<b>Line fault (2)</b> A line supply fault has occurred (phase failure, voltage level ...). Check the line supply and fuses. Check the supply voltage. Check the wiring.	9001	1	17	24	1
<b>Supply voltage fault (3)</b> An electronics supply voltage fault (48 V, 24 V, 5 V ...) was detected. Check the wiring. Check the voltage level.	9002	2	2 <sup>1</sup> 3 <sup>2</sup>	2 <sup>1</sup> 3 <sup>2</sup>	15
<b>DC-link overvoltage (4)</b> The DC-link voltage has assumed an inadmissibly high value. Check the dimensioning of the system (line supply, reactor, voltages). Check the infeed settings.	9003	3	18	24	2
<b>Power electronics fault (5)</b> An impermissible operating state of the power electronics was detected (overcurrent, overtemperature, IGBT failure ...). Check compliance with the permissible load cycles. Check the ambient temperatures (fan).	9004	4	19	24	3
<b>Overtemperature of the electronic component (6)</b> The temperature in the component has exceeded the highest permissible limit. Check the ambient temperature / control cabinet ventilation.	9005	5	20	5	4
<b>Ground fault / inter-phase short-circuit detected (7)</b> A ground fault / inter-phase short-circuit was detected in the power cables or in the motor windings. Check the power cables (connection). Check the motor.	9006	6	21	20	5
<b>Motor overload (8)</b> The motor was operated outside the permissible limits (temperature, current, torque ...). Check the load cycles and set limits. Check the ambient temperature / motor cooling.	9007	7	22	24	6

<b>Communication to the higher-level controller faulted (9)</b> The communication to the higher-level controller (internal coupling, PROFIBUS, PROFINET ...) is faulted or interrupted. Check the state of the higher-level controller. Check the communication connection/-wiring. Check the bus configuration/cycles.	9008	8	23	19	7
<b>Safety monitoring channel has detected an error (10)</b> A safe operation monitoring function has detected an error.	9009	9	24	25	8
<b>Actual position/speed value incorrect or not available (11)</b> An illegal signal state was detected while evaluating the encoder signals (track signals, zero marks, absolute values ...). Check the encoder / state of the encoder signals. Observe the maximum permissible frequencies.	900A	10	25	29	9
<b>Internal (DRIVE-CLiQ) communication faulted (12)</b> The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles.	900B	11	26	31	10
<b>Infeed fault (13)</b> The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control.	900C	12	27	24	11
<b>Braking controller / Braking Module faulted (14)</b> The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration.	900D	13	28	24	15
<b>Line filter fault (15)</b> The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds).	900E	14	17	24	15
<b>External measured value / signal state outside of the permissible range (16)</b> A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds.	900F	15	29	26	15
<b>Application / technological function faulty (17)</b> The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller.	9010	16	30	9	15

<b>Error in the parameterization/configuration/commissioning procedure (18)</b> An error was identified in the parameterization or in a commissioning procedure, or the parameterization does not match the actual device configuration. Determine the precise cause of the fault using the commissioning tool. Adapt the parameterization or device configuration.	9011	17	31	16	15
<b>General drive fault (19)</b> Group fault. Determine the precise cause of the fault using the commissioning tool.	9012	18	9	9	15
<b>Auxiliary unit fault (20)</b> The monitoring of an auxiliary unit (incoming transformer, cooling unit ...) has detected an illegal state. Determine the exact cause of the fault and check the relevant device.	9013	19	29	26	15

1. Undervoltage condition of the electronics power supply
2. Overvoltage condition of the electronics power supply

**Drive object:**

Each message (fault/alarm) specifies the drive object in which it can be found.  
A message can belong to either one, several, or all drive objects.

**Reaction: Default fault reaction (adjustable fault reaction)**

Specifies the default reaction in the event of a fault.  
The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

---

**Note**

See Table "Fault reactions (Page 917)"

---

**Acknowledgment: Default acknowledgment (adjustable acknowledgment)**

Specifies the default method of acknowledging faults after the cause has been eliminated.  
The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

---

**Note**

See Table "Acknowledging faults (Page 918)"

---

**Cause:**

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

**Remedy:**

Describes the methods available for eliminating the cause of the active fault or alarm.

	<b>WARNING</b>
In certain cases, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.	

**4.1.3 Number ranges of faults and alarms****Note:**

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms (Page 927)".

Faults and alarms are organized into the following number ranges:

Table 4-5 Number ranges of faults and alarms

<b>Drive object:</b>	All objects
<b>Component:</b>	Control Unit (CU)
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	POWER ON
<b>Cause:</b>	An exception occurred during an operation with the FloatingPoint data type. The error may be caused by the basic system or a technology function (e.g. FBLOCKS, DCC, TEC). Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting. Note: Refer to r9999 for further information about this fault. r9999[0]: Fault number. r9999[1]: Program counter at the time when the exception occurred. r9999[2]: Cause of the FloatingPoint exception. Bit 0 = 1: Operation invalid Bit 1 = 1: Division by zero Bit 2 = 1: Overflow Bit 3 = 1: Underflow Bit 4 = 1: Inaccurate result
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - check configuration and signals of the blocks in FBLOCKS. - check configuration and signals of DCC charts. - check configuration and signals of TEC charts. - upgrade firmware to later version. - contact Technical Support.

<b>Message class:</b>	Hardware/software error (1)		
<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	IMMEDIATELY		

**Cause:** It was not possible to download the firmware to a DRIVE-CLiQ component.  
 Fault value (r0949, interpret hexadecimal):  
 yyxxxx hex: yy = component number, xxxx = fault cause  
 xxxx = 000B hex = 11 dec:  
 DRIVE-CLiQ component has detected a checksum error.  
 xxxx = 000F hex = 15 dec:  
 The selected DRIVE-CLiQ component did not accept the contents of the firmware file.  
 xxxx = 0012 hex = 18 dec:  
 Firmware version is too old and is not accepted by the component.  
 xxxx = 0013 hex = 19 dec:  
 Firmware version is not suitable for the hardware release of the component.  
 xxxx = 0065 hex = 101 dec:  
 After several communication attempts, no response from the DRIVE-CLiQ component.  
 xxxx = 008B hex = 139 dec:  
 Initially, a new boot loader is loaded (must be repeated after POWER ON).  
 xxxx = 008C hex = 140 dec:  
 Firmware file for the DRIVE-CLiQ component not available on the memory card.  
 xxxx = 008D hex = 141 dec:  
 An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.  
 xxxx = 008F hex = 143 dec:  
 Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.  
 xxxx = 0090 hex = 144 dec:  
 When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.  
 xxxx = 0091 hex = 145 dec:  
 Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.  
 xxxx = 009C hex = 156 dec:  
 Component with the specified component number is not available (p7828).  
 xxxx = Additional values:  
 Only for internal Siemens troubleshooting.

**Remedy:**

- check the selected component number (p7828).
- check the DRIVE-CLiQ wiring.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download firmware again. Depending on p7826, the firmware will be automatically downloaded.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		
<b>Cause:</b>	The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component.		
<b>Remedy:</b>	Update the firmware using the commissioning tool: The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out. Firmware update via parameter: - take the component number from the alarm value and enter into p7828. - start the firmware download with p7829 = 1.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	The project download was interrupted. Fault value (r0949, interpret decimal): 1: The user prematurely interrupted the project download. 2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn). 3: The project download was prematurely exited by the commissioning tool. 100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card". Note: The response to an interrupted download is the state "first commissioning".		
<b>Remedy:</b>	- check the communication cable. - download the project again. - boot from previously saved files (switch-off/switch-on or p0976). - when loading into the file system (download from memory card), use the matching version.

<b>Cause:</b>	At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory. Alarm value (r2124, interpret decimal): 0: Checksum of one file is incorrect. 1: File missing. 2: File too many. 3: Incorrect firmware version. 4: Incorrect checksum of the back-up file.		
<b>Remedy:</b>	For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition. Note: The file involved can be read out using parameter r9925. The status of the firmware check is displayed using r9926. See also: r9925 (Firmware file incorrect), r9926 (Firmware check status)

## 4 Faults and alarms

### 4.2 List of faults and alarms

<b>Cause:</b>	On the memory card, one file in the directory /SIEMENS/SINAMICS/DATA or /ADDON/SINAMICS/DATA has been illegally changed with respect to that supplied from the factory. No changes are permitted in this directory. Alarm value (r2124, interpret decimal): zyx dec: x = Problem, y = Directory, z = File name x = 1: File does not exist. x = 2: Firmware version of the file does not match the software version. x = 3: File checksum is incorrect. y = 0: Directory /SIEMENS/SINAMICS/DATA/ y = 1: Directory /ADDON/SINAMICS/DATA/ z = 0: File MOTARM.ACX z = 1: File MOTSRM.ACX z = 2: File MOTSLM.ACX z = 3: File ENCDATA.ACX z = 4: File FILTDATA.ACX z = 5: File BRKDATA.ACX z = 6: File DAT_BEAR.ACX z = 7: File CFG_BEAR.ACX z = 8: File ENC_GEAR.ACX z = 9: File CFG_BRK.ACX z = 10: File THERMMOTMOD.ACX z = 11: File MAPPING.ACX z = 12: File LOADGEAR.ACX z = 13: File MOTRSM.ACX
<b>Remedy:</b>	For the file on the memory card involved, restore the status originally supplied from the factory.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	POWER ON		
<b>Cause:</b>	Module bootling was interrupted several times. As a consequence, the module boots with the factory setting. Possible reasons for bootling being interrupted: - power supply interrupted. - CPU crashed. - parameterization invalid.		
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on). After switching on, the module reboots from the valid parameterization (if available). - restore the valid parameterization. Examples: a) Carry out a first commissioning, save, carry out a POWER ON (switch-off/switch-on). b) Load another valid parameter backup (e.g. from the memory card), save, carry out a POWER ON (switch-off/switch-on). Note: If the fault situation is repeated, then this fault is again output after several interrupted boots.

#### F01043

#### Fatal error at project download

**Message value:** Fault cause: %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** All objects

**Component:** None

**Propagation:** LOCAL

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A fatal error was detected when downloading a project using the commissioning tool.

Fault value (r0949, interpret decimal):

- 1: Device status cannot be changed to Device Download (drive object ON?).
- 2: Incorrect drive object number.
- 3: A drive object that has already been deleted is deleted again.
- 4: Deleting of a drive object that has already been registered for generation.
- 5: Deleting a drive object that does not exist.
- 6: Generating an undeleted drive object that already existed.
- 7: Regenerating a drive object already registered for generation.
- 8: Maximum number of drive objects that can be generated exceeded.
- 9: Error while generating a device drive object.
- 10: Error while generating target topology parameters (p9902 and p9903).
- 11: Error while generating a drive object (global component).
- 12: Error while generating a drive object (drive component).
- 13: Unknown drive object type.
- 14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).
- 15: Drive status cannot be changed to drive download.
- 16: Device status cannot be changed to "ready for operation".
- 17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.
- 18: A new download is only possible if the factory settings are restored for the drive unit.
- 19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)
- 20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A\_INF, SERVO or VECTOR).
- 21: Error when accepting the download parameters.
- 22: Software-internal download error.
- 23: download not possible when know-how protection is activated.
- 24: download not possible during a partial power up after inserting a component.
- 25: The configuration is inconsistent. Know-how protection is either not activated or only partially.

Additional values:

Only for internal Siemens troubleshooting.

**Remedy:**

- use the current version of the commissioning tool.
- modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
- change the drive state (is a drive rotating or is there a message/signal?).
- carefully note any other active messages/signals and remove their cause (e.g. correct any incorrectly set parameters).
- automatically calculate the control parameters (p0340). Then set p0010 = 0.
- boot from previously saved files (switch-off/switch-on or p0976).
- before a new download, restore the factory setting if the know-how protection was not activated on all drive objects.

<b>Cause:</b>	An error was detected when evaluating the parameter files PSxxxxxyy.ACX, PTxxxxyy.ACX, CAxxxxyy.ACX, or CCxxxxyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408. Alarm value (r2124, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- check the parameters displayed in r9406 up to r9408, and correct these if required. - Restore the factory setting using (p0976 = 1) and re-load the project into the drive unit. Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn. <b>Drive object:</b>	All objects		
<b>Component:</b>	Control Unit (CU)	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	At least one system overload has been identified. Fault value (r0949, interpret decimal): 1: Computing time load too high (r9976[1]). 5: Peak load too high (r9976[5]). Note: As long as this fault is present, it is not possible to save the parameters (p0971, p0977). See also: r9976 (System utilization)		
<b>Remedy:</b>	For fault value = 1, 5: - reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %. - check the sampling times and adjust if necessary (p0115, p0799, p4099). - deactivate function modules. - deactivate drive objects. - remove drive objects from the target topology. - note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology. When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies: - the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS). - if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001). - if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

### 4.2 List of faults and alarms

**Cause:** The parameter assignment on the visible partition of the memory card has changed.  
In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.

**Note:**  
It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).

**Remedy:**

**Cause:** A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.  
Fault value (r0949, interpret decimal):  
1: The component does not support the deactivation.  
101: The Motor Module does not support an internal armature short-circuit.  
102: The Motor Module does not support the deactivation.  
201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.  
202: The Sensor Module does not support parking/unparking.  
203: The Sensor Module does not support the deactivation.  
204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.  
205: The Sensor Module does not support the selected temperature evaluation (r0458, r0459).  
206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.  
207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.  
208: The Sensor Module does not support de-selection of commutation with zero mark (via p0430.23).  
211: The Sensor Module does not support single-track encoders (r0459.10).  
212: The Sensor Module does not support LVDT sensors (p4677.0).  
213: The Sensor Module does not support the characteristic type (p4662).  
214: The power unit does not support the temperature evaluation via PT1000 (r0193).  
215: The Terminal Module does not support the temperature evaluation via PT1000  
216: The Voltage Sensing Module (VSM) does not support operation with a PT1000 temperature sensor.

**Remedy:** Upgrade the firmware of the DRIVE-CLiQ component involved.  
 For fault value = 205, 214, 215:  
 - check parameter p0600 and p0601 and if required, adapt.  
 For fault value = 207:  
 - replace the power unit or if required set the device supply voltage higher (p0210).  
 For fault value = 208:  
 - check parameter p0430.23 and reset if necessary.  
 For fault value = 216:  
 - check the setting of the sensor type (p3665).  
 - use a Voltage Sensing module that supports operation with PT1000 (MLFB ...-xxx1).

## 4 Faults and alarms

### 4.2 List of faults and alarms

<b>Cause:</b>	<p>For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.</p> <p>Fault value (r0949, interpret hexadecimal): xyy hex: x = fault cause, yy = component number or connection number.</p> <p>1yy: The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.</p> <p>2yy: The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.</p> <p>3yy: Cyclic communication is fully utilized.</p> <p>4yy: The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.</p> <p>The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.</p> <p>5yy: Internal buffer overflow for net data of a DRIVE-CLiQ connection.</p> <p>6yy: Internal buffer overflow for receive data of a DRIVE-CLiQ connection.</p> <p>7yy: Internal buffer overflow for send data of a DRIVE-CLiQ connection.</p> <p>8yy: The component clock cycles cannot be combined with one another</p> <p>900: The lowest common multiple of the clock cycles in the system is too high to be determined.</p> <p>901: The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.</p>
<b>Remedy:</b>	<ul style="list-style-type: none"><li>- check the DRIVE-CLiQ wiring.</li><li>- reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.</li></ul> <p>For fault value = 1yy - 4yy in addition:</p> <ul style="list-style-type: none"><li>- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.</li><li>- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).</li><li>- reduce the function modules (r0108).</li><li>- establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the Article No.)).</li><li>- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.</li></ul> <p>For fault value = 8yy in addition:</p> <ul style="list-style-type: none"><li>- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.</li></ul> <p>For fault value = 9yy in addition:</p> <ul style="list-style-type: none"><li>- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.</li></ul>

**Acknowledge:**

**Remedy:** One of the following counter-measures can be selected if no faults have occurred in the topology detection itself:  
 If commissioning is still not completed:  
 - carry out a self-commissioning routine (starting from p0009 = 1).  
 In general:  
 Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107).  
 Generating servo drives: Set p0097 to 1, set p0009 to 0.  
 Generating vector drives: Set p0097 to 2, set p0009 to 0.  
 Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0.  
 In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).  
 If commissioning has already been completed:  
 - re-establish the original connections and re-connect power to the Control Unit.  
 - restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.  
 - change the device parameterization to match the connections (this is only possible using the commissioning tool).  
 Notice:  
 Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning tool and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE (OFF2)		
<b>Acknowledge:</b>	IMMEDIATELY		

<b>Cause:</b>	In the actual topology, 2 Control Units are connected with one another through DRIVE-CLiQ. As standard, this is not permitted. This is only permitted if the Technology Extension OALINK has already been installed on the two Control Units and has been commissioned online. Fault value (r0949, interpret hexadecimal): yyxx hex: yy = connection number of the Control Unit at which the second Control Unit is connected xx = component number of the Control Unit at which the second Control Unit is connected Note: Pulse enable is withdrawn and prevented.
<b>Remedy:</b>	In general: - remove the connection to the second Control Unit and restart. - for the S120M component DRIVE-CLiQ extension, interchange the hybrid cable (IN/OUT). When using OALINK: - remove the DRIVE-CLiQ connection and restart the systems. - install OALINK on both Control Units and activate. - Check the configuration of the DRIVE-CLiQ sockets in OALINK.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	BICO
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	IMMEDIATELY		

**Cause:** The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.  
An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different.  
Example 1:  
BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.  
p2002: contains the reference value for current  
p2001: contains the reference value for voltage  
Example 2:  
BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input.  
p2001: contains the reference value for voltage, drive objects 1, 2

<b>Component:</b>	None <b>Propagation:</b> LOCAL
<b>Reaction:</b>	NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	A DRIVE-CLiQ connection fault has occurred. Fault value (r0949, interpret decimal): 100 ... 107: Communication via DRIVE-CLiQ socket X100 ... X107 has not been switched to cyclic operation. The cause may be an incorrect structure or a configuration that results in an impossible bus timing. 10: Loss of the DRIVE-CLiQ connection. The cause may be, for example, that the DRIVE-CLiQ cable was withdrawn from the Control Unit or as a result of a short-circuit for motors with DRIVE-CLiQ. This fault can only be acknowledged in cyclic communication. 11: Repeated faults when detecting the connection. This fault can only be acknowledged in cyclic communication. 12: A connection was detected but the node ID exchange mechanism does not function. The reason is probably that the component is defective. This fault can only be acknowledged in cyclic communication.
<b>Remedy:</b>	For fault value = 100 ... 107: - ensure that the DRIVE-CLiQ components have the same firmware versions. - avoid longer topologies for short current controller sampling times. For fault value = 10: - check the DRIVE-CLiQ cables at the Control Unit. - remove any short-circuit for motors with DRIVE-CLiQ. - carry out a POWER ON. For fault value = 11: - check the electrical cabinet design and cable routing for EMC compliance For fault value = 12: - replace the component involved.

<b>A01839</b>	<b>DRIVE-CLiQ diagnostics: cable fault to the component</b>
<b>Message value:</b>	Component number: %1
<b>Message class:</b>	General drive fault (19)
<b>Drive object:</b>	All objects
<b>Component:</b>	Control Unit (CU) <b>Propagation:</b> GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE

<b>Cause:</b>	The fault counter (r9936[0...199]) to monitor the DRIVE-CLiQ connections/cables has been incremented. Alarm value (r2124, interpret decimal): Component number. Note: The component number specifies the component whose feeder cable from the direction of the Control Unit is faulted. The alarm automatically disappears after 5 seconds, assuming that no other data transfer error has occurred. See also: r9936 (DRIVE-CLiQ diagnostic error counter connection)
<b>Remedy:</b>	- check the corresponding DRIVE-CLiQ cables. - check the electrical cabinet design and cable routing for EMC compliance

<b>A01900 (F)</b>	<b>PB/PN: Configuration telegram error</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Drive object:</b>	All objects
<b>Component:</b>	None
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	A controller attempts to establish a connection using an incorrect configuring telegram. Alarm value (r2124, interpret decimal): 1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978. 2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is determined by the number of indices in r2050/p2051. 3: Uneven number of bytes for input or output. 4: Setting data for synchronization not accepted. For more information, see A01902. 211: Unknown parameterizing block. 223: Clock synchronization for the PZD interface set in p8815[0] is not permissible. More than one PZD interface is operated in clock synchronism. 253: PN Shared Device: Illegal mixed configuration of PROFIsafe and PZD. 254: PN Shared Device: Illegal double assignment of a slot/subslot. 255: PN: Configured drive object and existing drive object do not match. 256: PN: configured telegram cannot be set. 500: Illegal PROFIsafe configuration for the interface set in p8815[1]. More than one PZD interface is operated with PROFIsafe. 501: PROFIsafe parameter error (e.g. F_dest). 502: PROFIsafe telegram does not match. 503: PROFIsafe connection is rejected as long as there is no isochronous connection (p8969). Additional values: Only for internal Siemens troubleshooting.

## 4 Faults and alarms

### 4.2 List of faults and alarms

<b>Remedy:</b>	Check the bus configuration on the master and the slave sides. For alarm value = 1, 2: - check the list of the drive objects with process data exchange (p0978). Note: With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange. For alarm value = 2: - check the number of data words for output and input to a drive object. For alarm value = 211: - Ensure offline version <= online version. For alarm value = 223, 500: - check the setting in p8839 and p8815. - check for inserted but not configured CBE20. - ensure that only one PZD interface is operated in clock synchronism or with PROFIsafe. For alarm value = 255: - check configured drive objects. For alarm value = 256: - check the configured telegram. For alarm value = 501: - check the set PROFIsafe address (p9610). For alarm value = 502: - check the set PROFIsafe telegram (p60022, p9611).

#### **A02041 Function generator: Illegal value for bandwidth**

**Message value:** -

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** All objects

**Component:** None

**Propagation:** BICO

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high.

Depending on the time slice clock cycle, the bandwidth is defined as follows:

$\text{Bandwidth\_max} = 1 / (2 \times \text{time slice clock cycle})$

$\text{Bandwidth\_min} = \text{Bandwidth\_max} / 100000$

Example:

Assumption: p4830 = 125  $\mu\text{s}$

-->  $\text{Bandwidth\_max} = 1 / (2 \times 125 \mu\text{s}) = 4000 \text{ Hz}$

-->  $\text{Bandwidth\_min} = 4000 \text{ Hz} / 100000 = 0.04 \text{ Hz}$

Note:

p4823: Function generator bandwidth

p4830: Function generator time slice clock cycle

See also: p4823 (Function generator bandwidth), p4830 (Function generator time slice cycle)

**Remedy:** Check the value for the bandwidth and adapt accordingly.

Note:

The alarm is reset as follows:

- remove the cause of this alarm.
- restart the function generator.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

- Cause:** It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 1).  
A multiple trace is not started or is canceled.  
Alarm value (r2124, interpret decimal):  
1: Memory card cannot be accessed.  
- card is not inserted or is blocked by a mounted USB drive.  
3: data save operation too slow.  
- a second trace has been completed before the measurement results of the first trace were able to be saved.  
- writing the measurement result files to the card is blocked by the parameter save.  
4: Data save operation canceled.  
- for instance, the file required for the data save operation was not able to be found.  
See also: p4840 (MTrace cycle number setting)
- Remedy:**
- insert or remove the memory card.
  - use a larger memory card.
  - configure a longer trace time or use an endless trace.
  - avoid saving parameters while a multiple trace is running.
  - check whether other functions are presently accessing measurement result files.

- Message value:** -
- Message class:** Error in the parameterization / configuration / commissioning procedure (18)
- Drive object:** All objects
- Component:** None **Propagation:** BICO
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** The memory space still available on the Control Unit is no longer sufficient for the trace function.
- Remedy:** Reduce the memory required, e.g. as follows:
- reduce the trace time.
  - increase the trace clock cycle.
  - reduce the number of signals to be traced.
- See also: r4708 (Trace memory space required), r4799 (Trace memory location free)

#### A02100

#### Drive: Computing dead time current controller too short

- Message value:** %1
- Message class:** Error in the parameterization / configuration / commissioning procedure (18)
- Drive object:** All objects
- Component:** None **Propagation:** GLOBAL
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** The value in p0118 produces a dead time of one clock cycle because it is prior to setpoint availability.  
Possible causes:
- a parameter backup with a version higher than 4.3 was loaded to a version less than or equal to 4.3.
  - the system properties after replacing a component no longer match the parameter assignment.
- Alarm value (r2134, floating point):  
Minimum value for p0118 where dead time no longer occurs.
- Remedy:**
- set p0118 to zero.
  - set p0118 to a value greater than or equal to the alarm value (for p1810.11 = 1)
  - set p0117 (from the device) to an automatic setting (p0117 = 1).
  - check the firmware versions of the components involved.

<b>Component:</b>	None
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	Open-loop/closed-loop control parameters have had to be changed. Possible causes: 1. As a result of other parameters, they have exceeded the dynamic limits. 2. They cannot be used due to the fact that the hardware detected not having certain features. 3. The value is estimated as the thermal time constant is missing. 4. Motor temperature model 1 is activated as thermal motor protection is missing. Fault value (r0949, interpret decimal): Changed parameter number. 340: The motor and control parameters were automatically calculated (p0340 = 1), because the vector control was subsequently activated as configuration (r0108.2). 611: The time constant for thermal motor model 1 was estimated. 612: Thermal motor model 1 was activated (p0612.0 = 1).
<b>Remedy:</b>	Not necessary. It is not necessary to change the parameters as they have already been correctly limited.

<b>Component:</b>	None
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation. The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting. Possible causes: - the steady-state minimum limit/maximum limit or that defined in the application was violated. Fault value (r0949, parameter): Diagnostics parameter to display the parameters that were not able to be re-calculated. **Drive object:** DC\_CTRL, DC\_CTRL\_R, DC\_CTRL\_R\_S, DC\_CTRL\_S  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A changeover of units was initiated. This resulted in a violation of a parameter limit  
Possible causes for the violation of a parameter limit:  
- When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated.  
- inaccuracies for the data type "FloatingPoint".  
In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.  
Fault value (r0949, interpret decimal):

<b>Cause:</b>	When switched off, the currently effective motor encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Note: Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in x = r0051 and the corresponding motor encoder is specified in in p0187[x]. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value after the measuring gear - if one is being used. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r2724. ## 4 Faults and alarms

### 4.2 List of faults and alarms

**Cause:** Only for power units:  
The encoder data set was not configured - this means that a data set number was not entered into the associated drive data set.  
Fault value (r0949, interpret decimal):  
The fault value includes the drive data set number of p0187, p0188 and p0189.  
The fault value is increased by 100 \* encoder number (e.g. for p0189: Fault value 3xx with xx = data set number).

**Remedy:** The index of the encoder data set associated with the drive data set should be entered into p0187 (1st encoder), p0188 (2nd encoder) and p0189 (3rd encoder).

**Cause:** A motor data set is not assigned to a drive object.  
All of the existing motor data sets in the drive data sets must be assigned using the MDS number (p0186[0...n]).  
There must be at least as many drive data sets as motor data sets.  
Alarm value (r2124, interpret decimal):

**Remedy:** In the drive data sets, assign the non-assigned motor data set using the MDS number (p0186[0...n]).  
- check whether all of the motor data sets are assigned to drive data sets.  
- if required, delete superfluous motor data sets.  
- if required, set up new drive data sets and assign to the corresponding motor data sets.

**Cause:** A Drive Data Set (DDS) is assigned to a Motor Data Set (MDS) or Encoder Data Set (EDS) that does not have a component number.  
Fault value (r0949, interpret decimal):  
nnmmmxxyy  
nn: Number of the MDS/EDS.  
mmm: Parameter number of the missing component number.  
xx: Number of the DDS that is assigned to the MDS/EDS.  
yyy: Parameter number that references the MDS/EDS.

Example:  
p0186[7] = 5: DDS 7 is assigned MDS 5.  
p0131[5] = 0: There is no component number set in MDS 5.  
Alarm value = 0513107186

<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Each encoder may only be assigned to one drive and within a drive must - in each drive data set - either always be encoder 1, always encoder 2 or always encoder 3. This unique assignment has been violated. Fault value (r0949, interpret decimal): The two parameters in coded form, that refer to the same component number. First parameter: Index: First and second decimal place (99 for EDS, not assigned DDS) Parameter number: Third decimal place (1 for p0187, 2 for p0188, 3 for p0189, 4 for EDS not assigned DDS) Drive number: Fourth and fifth decimal place Second parameter: Index: Sixth and seventh decimal place (99 for EDS, not assigned DDS) Parameter number: Eighth decimal place (1 for p0187, 2 for p0188, 3 for p0189, 4 for EDS, not assigned DDS) Drive number: Ninth and tenth decimal place See also: p0141 (Encoder interface (Sensor Module) component number)

<b>Component:</b>	None
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Using p0141, a changeover of the encoder data set is prepared that is illegal. In this firmware release, an encoder data set changeover is only permitted for the components in the actual topology. Fault value (r0949, interpret decimal): Incorrect EDS data set number. See also: p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number)
<b>Remedy:</b>	Every encoder data set must be assigned its own dedicated DRIVE-CLiQ socket. The component numbers of the encoder interfaces (p0141) must have different values within a drive object. The following must apply: p0141[0] not equal to p0141[1] not equal to ... not equal to p0141[n]

<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	In at least two drive data sets (DDS), the same motor data set (MDS) is assigned different encoder data sets (EDS) for the motor encoder. In various DDSs, it is not permissible for an MDS to have different motor encoders. The following parameterization therefore results results in an error: DDS0: p0186[0] = 0, p0187[0] = 0 DDS1: p0186[1] = 0, p0187[1] = 1 Fault value (r0949, interpret decimal): The lower 16 bits indicate the first DDS. The upper 16 bits indicate the second DDS.		
<b>Remedy:</b>	Create two MDS with the same motor data in order to operate one motor with different motor encoders. Example: DDS0: p0186[0] = 0, p0187[0] = 0 DDS1: p0186[1] = 1, p0187[1] = 1

yyyy = 1 dec:  
The motor encoder used does not supply an absolute commutation angle.  
yyyy = 2 dec:  
The selected ratio of the measuring gear does not match the motor pole pair number.

**Remedy:**  
For fault cause = 1:  
- check the encoder parameterization (p0404).  
- use an encoder with track C/D, EnDat interface of Hall sensors.  
- use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) multiplied by the gear ratio (p0432/p0433) is less than the encoder pulse number (p0408) – or is an integer multiple of the encoder pulse number (p0408).  
- activate the pole position identification routine (p1982 = 1).  
For fault cause = 2:  
- the quotient of the pole pair number divided by the ratio of the measuring gear must be an integer number: (p0314 \* p0433) / p0432.  
Note:  
For operation with track C/D, this quotient must be less than 8.

**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The multiturn resolution in p0421 must be to the power of two.  
 Fault value (r0949, interpret decimal):  
 The fault value includes the encoder data set number involved.  
**Remedy:**  
 - check the parameterization (p0421, p0404.1, r0458.5).  
 - upgrade the Sensor Module firmware if necessary

**F07562 (A) Drive, encoder: Position tracking, incremental encoder not possible**

**Message value:** Fault cause: %1, component number: %2, encoder data set: %3  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** DC\_CTRL, DC\_CTRL\_R, DC\_CTRL\_R\_S, DC\_CTRL\_S  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The requested position tracking for incremental encoders is not supported.  
 Fault value (r0949, interpret hexadecimal):  
 ccccbbaa hex  
 aa = encoder data set  
 bb = component number  
 cccc = fault cause  
 cccc = 00 hex = 0 dec  
 The encoder type does not support the "Position tracking incremental encoder" function.  
 cccc = 01 hex = 1 dec  
 Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM.  
 cccc = 04 hex = 4 dec  
 A linear encoder is used that does not support the "position tracking" function.  
 See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration), r0456 (Encoder configuration supported)  
**Remedy:**  
 - check the encoder parameterization (p0400, p0404).  
 - use a Control Unit with sufficient NVRAM.  
 - if required, de-select position tracking for the incremental encoder (p0411.3 = 0).

**Cause:** During encoder identification (waiting) with p0400 = 10100, the encoder could still not be identified.  
Either the wrong encoder has been installed or no encoder has been installed, the wrong encoder cable has been connected or no encoder cable has been connected to the Sensor Module, or the DRIVE-CLiQ component has not been connected.  
Note:  
Encoder identification must be supported by the encoder and is possible in the following cases:  
- Encoder with EnDat interface.  
- Encoder with SSI interface.  
- Motor with DRIVE-CLiQ.

**Remedy:**  
- check and, if necessary, connect the encoder / encoder cable.  
- check and, if necessary, establish the DRIVE-CLiQ connection.  
- for SSI encoders, carry out the required operator actions (see the Function Manual).

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		

**Cause:** The drive unit did not accept the receive configuration data.  
Alarm value (r2124, interpret decimal):  
Return value of the receive configuration data check.  
1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978.  
2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is determined by the number of indices in r2050/p2051 for PZD IF1, and in r8850/p8851 for PZD IF2.  
3: Uneven number of bytes for input or output.  
4: Setting data for synchronization not accepted. For more information, see A01902.  
5: Cyclic operation not active.  
17: CBE20 Shared Device: Configuration of the F-CPU has been changed.  
223: Illegal clock synchronization for the PZD interface set in p8815[0].  
500: Illegal PROFIsafe configuration for the interface set in p8815[1].  
501: PROFIsafe parameter error (e.g. F\_dest).  
503: PROFIsafe connection is rejected as long as there is no isochronous connection (p8969).  
Additional values:  
Only for internal Siemens troubleshooting.

**Remedy:** Check the receive configuration data.  
For alarm value = 1, 2:  
- check the list of the drive objects with process data exchange (p0978). With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange.

#### **A08550 PZD Interface Hardware assignment error**

**Message value:** %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** CU\_DC, CU\_DC\_R, CU\_DC\_R\_S, CU\_DC\_S

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The assignment of the hardware to the PZD interface has been incorrectly parameterized.

Alarm value (r2124, interpret decimal):

1: Only one of the two indices is not equal to 99 (automatic).

2: Both PZD interfaces are assigned to the same hardware.

3: Assigned COMM BOARD missing.

See also: p8839 (PZD interface hardware assignment)

**Remedy:** Check the parameterization and if required, correct (p8839).

<b>Component:</b>	Power Module	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	OFF2		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	The power unit has detected an overcurrent condition. - closed-loop control is incorrectly parameterized. - motor has a short-circuit or fault to ground (frame). - U/f operation: Up ramp set too low. - U/f operation: Rated motor current is significantly greater than that of the Motor Module. - infeed: High discharge and post-charging currents for line voltage dip. - infeed: High post-charging currents for overload when motoring and DC link voltage dip. - infeed: Short-circuit currents at switch-on as there is no commutating reactor. - power cables are not correctly connected. - the power cables exceed the maximum permissible length. - power unit defective. - line phase interrupted. Additional causes for a parallel switching device (r0108.15 = 1): - a power unit has tripped (switched off) due to a ground fault. - the closed-loop circulating current control is either too slow or has been set too fast. Fault value (r0949, interpret bitwise binary): Bit 0: Phase U. Bit 1: Phase V. Bit 2: Phase W. Bit 3: Overcurrent in the DC link. Note: Fault value = 0 means that the phase with overcurrent is not recognized (e.g. for blocksize device).		

- Remedy:**
- check the motor data - if required, carry out commissioning.
  - check the motor circuit configuration (star/delta).
  - U/f operation: Increase up ramp.
  - U/f operation: Check the assignment of the rated currents of the motor and Motor Module.
  - infeed: Check the line supply quality.
  - infeed: Reduce the motor load.
  - infeed: Check the correct connection of the line filter and the line commutating reactor.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.
  - replace power unit.
  - check the line supply phases.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
  - check the setting of the closed-loop circulating current control (p7036, p7037).

**Acknowledge:** IMMEDIATELY  
**Cause:** The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949, interpret decimal):  
Temperature [0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

**Notice:**  
This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The power unit was overloaded (r0036 = 100 %).

- the permissible rated power unit current was exceeded for an inadmissibly long time.
- the permissible load duty cycle was not maintained.

Fault value (r0949, interpret decimal):  
I2t [100 % = 16384].

**Remedy:**

- reduce the continuous load.
- adapt the load duty cycle.
- check the motor and power unit rated currents.

#### Power unit: Thyristor Control Board

**Message value:** -  
**Message class:** Power electronics faulted (5)  
**Drive object:** DC\_CTRL, DC\_CTRL\_R, DC\_CTRL\_R\_S, DC\_CTRL\_S  
**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY

**Cause:** The Thyristor Control Board (TCB) of the Basic Line Module signals a fault.

- there is no line supply voltage.
- the line contactor is not closed.
- the line supply voltage is too low.
- line supply frequency outside the permissible range (45 ... 66 Hz).
- there is a DC link short-circuit.
- there is a DC link short-circuit (during the precharging phase).
- the motor either has a short-circuit or insulation fault (from an inverter connected to the DC link).
- voltage supply for the Thyristor Control Board outside the nominal range (5 ... 18 V) and line voltage >30 V.
- there is an internal fault in the Thyristor Control Board.

**Remedy:** The faults must be saved in the Thyristor Control Board and must be acknowledged. To do this, the supply voltage of the Thyristor Control Board must be switched out for at least 10 s!

- check the line supply voltage
- check or energize the line contactor.
- check the monitoring time and, if required, increase (p0857).
- if required, observe additional power unit messages/signals.
- check the DC link regarding short-circuit or ground fault.
- check the motor regarding short-circuit or ground fault.
- evaluate diagnostic LEDs for the Thyristor Control Board.

## 4 Faults and alarms

### 4.2 List of faults and alarms

---

**Cause:** At the power unit, the DC link voltage ripple has exceeded the permissible limit value.  
Possible causes:

- a line phase has failed.
- the 3 line phases are inadmissibly asymmetrical.
- the capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.
- the fuse of a phase of a main circuit has ruptured.
- a motor phase has failed.
- for power units operated on a single phase, the permissible active power was exceeded.

Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- check the main circuit fuses.
- check whether a single-phase load is distorting the line voltages.
- Detune the resonant frequency with the line inductance by using an upstream line reactor.
- Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.
- check the motor feeder cables.

**F30017 Power unit: Hardware current limit has responded too often**

**Message value:** Fault cause: %1 bin  
**Message class:** Power electronics faulted (5)  
**Drive object:** DC\_CTRL, DC\_CTRL\_R, DC\_CTRL\_R\_S, DC\_CTRL\_S  
**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY

**Cause:** The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit.

For infeed units, the following applies:

- closed-loop control is incorrectly parameterized.
- load on the infeed is too high.
- Voltage Sensing Module incorrectly connected.
- line reactor missing or the incorrect type.
- power unit defective.

The following applies to Motor Modules:

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):  
Bit 3: phase U  
Bit 4: phase V  
Bit 5: phase W  
Additional bits:  
Only for internal Siemens troubleshooting.

**Note:**  
Fault value = 0 means that the phase with current limiting is not recognized (e.g. for blocksize device).

**Remedy:**

For infeed units, the following applies:

- check the controller settings and reset and identify the controller if necessary (p0340 = 2, p3410 = 5)
- reduce the load and increase the DC link capacitance or use a higher-rating infeed if necessary
- check the connection of the optional Voltage Sensing Module
- check the connection and technical data of the line reactor
- check the power cables for short-circuit or ground fault.
- replace power unit.

The following applies to Motor Modules:

- check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
- check the motor circuit configuration (star-delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

**Reaction:**

**Acknowledge:**

IMMEDIATELY

**Cause:**

The power has detected a ground fault.

Possible causes:

- ground fault in the power cables.
- ground fault at the motor.
- CT defective.
- when the brake closes, this causes the hardware DC current monitoring to respond.
- short-circuit at the braking resistor.
- the closed-loop circulating current control for devices connected in parallel (r0108.15 = 1) is either too slow or has been set too fast.

Note:

For power units, a ground fault is also emulated in r3113.5.

Fault value (r0949, interpret decimal):

0:

- the hardware DC current monitoring has responded.
- short-circuit at the braking resistor.

> 0:

Absolute value, total current amplitude [20479 = r0209 \* 1.4142].

**Remedy:**

- check the power cable connections.
  - check the motor.
  - check the CT.
  - check the cables and contacts of the brake connection (a wire is possibly broken).
  - check the braking resistor.
- For parallel switching devices (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
  - check the setting of the closed-loop circulating current control (p7036, p7037).

- ambient temperature too high.  
- pulse frequency too high.  
Fault value (r0949, interpret decimal):  
Temperature difference between the heat sink and chip [0.01 °C].  
**Remedy:**  
- adapt the load duty cycle.  
- check whether the fan is running.

**Remedy:** In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).

For booksize drive units, the following applies:

- wait (approx. 8 minutes) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

For 5):

- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).

For 6):

- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Equipment Manual)

For 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

For 8):

- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.

For 9):

- check the DC link for ground faults or short circuits.

For 11):

- check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).

If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** Communications between the Control Unit (CU) and Power Module (PM) via the interface no longer possible. The CU may have been withdrawn or is incorrectly inserted.  
Fault value (r0949, interpret hexadecimal):  
0 hex:  
- a Control Unit with external 24 V supply was withdrawn from the Power Module during operation.  
- with the Power Module switched off, the external 24 V supply for the Control Unit was interrupted for some time.  
1 hex:  
The Control Unit was withdrawn from the Power Module during operation, although the encoderless safe motion monitoring functions are enabled. This is not supported. After re-inserting the Control Unit in operation, communications to the Power Module no longer possible.  
20A hex:

#### **F30081 Power unit: Switching operations too frequent**

**Message value:** Fault cause: %1 bin  
**Message class:** Power electronics faulted (5)  
**Drive object:** DC\_CTRL, DC\_CTRL\_R, DC\_CTRL\_R\_S, DC\_CTRL\_S  
**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY

- Cause:**
- The power unit has executed too many switching operations for current limitation.
  - closed-loop control is incorrectly parameterized.
  - motor has a short-circuit or fault to ground (frame).
  - U/f operation: Up ramp set too low.
  - U/f operation: rated current of motor much greater than that of power unit.
  - infeed: High discharge and post-charging currents for line voltage dip.
  - infeed: High post-charging currents for overload when motoring and DC link voltage dip.
  - infeed: Short-circuit currents at switch-on as there is no commutating reactor.
  - power cables are not correctly connected.
  - power cables exceed the maximum permissible length.
  - power unit defective.
- Additional causes for a parallel switching device (r0108.15 = 1):
- a power unit has tripped (switched off) due to a ground fault.
  - the closed-loop circulating current control is either too slow or has been set too fast.
- Fault value (r0949, interpret bitwise binary):
- Bit 0: Phase U.  
 Bit 1: Phase V.  
 Bit 2: Phase W.
- Remedy:**
- check the motor data - if required, carry out commissioning.
  - check the motor circuit configuration (star-delta)
  - U/f operation: Increase up ramp.
  - U/f operation: Check assignment of rated currents of motor and power unit.
  - infeed: Check the line supply quality.
  - infeed: Reduce the motor load.
  - infeed: Correct connection of the line reactor.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.
  - replace power unit.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
  - check the setting of the closed-loop circulating current control (p7036, p7037).

<b>Component:</b>	Power Module <b>Propagation:</b> LOCAL
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Fault detected on the DRIVE-CLiQ component (power unit) involved. Faulty hardware cannot be excluded. Fault cause: 32 (= 20 hex): Error in the telegram header. 35 (= 23 hex): Receive error: The telegram buffer memory contains an error. 66 (= 42 hex): Send error: The telegram buffer memory contains an error. 67 (= 43 hex): Send error: The telegram buffer memory contains an error. 96 (= 60 hex): Response received too late during runtime measurement. 97 (= 61 hex): Time taken to exchange characteristic data too long. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
<b>Remedy:</b>	- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...). - check the electrical cabinet design and cable routing for EMC compliance - if required, use another DRIVE-CLiQ socket (p9904). - replace the component involved.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Cause:** The properties of the DRIVE-CLiQ component (power unit), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.  
Fault value (r0949, interpret decimal):  
Component number.

**Remedy:** - carry out a POWER ON.  
- when a component is replaced, the same component type and if possible the same firmware version should be used.  
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** A fault occurred on the power unit that cannot be interpreted by the Control Unit firmware.  
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Fault value (r0949, interpret decimal):  
Fault number.  
Note:  
If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the power unit by an older firmware version (r0128).  
- upgrade the firmware on the Control Unit (r0018).

<b>F31100 (N, A)</b>	<b>Encoder 1: Zero mark distance error</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	DC_CTRL, DC_CTRL_R, DC_CTRL_R_S, DC_CTRL_S
<b>Component:</b>	Encoder 1 <b>Propagation:</b> LOCAL
<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

<b>Cause:</b>	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the clearance between zero marks (p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - when p0437.1 is active, check p4686. - replace the encoder or encoder cable.

<b>Cause:</b>	For an HTL/TTL encoder, the speed change has exceeded the value in p0492 over several sampling cycles. The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time. Encoder 1 is used as motor encoder and can be effective has fault response to change over to encoderless operation. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: p0492 (Square-wave encoder maximum speed difference per sampling cycle)
<b>Remedy:</b>	- check the tachometer feeder cable for interruptions. - check the grounding of the tachometer shielding. - if required, increase the maximum speed difference per sampling cycle (p0492).

<b>Reaction:</b>	ENCODER (IASC/DCBRK, NONE)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	An encoder power supply fault was detected. Fault value (r0949, interpret binary): Bit 0: Undervoltage condition on the sense line. Bit 1: Overcurrent condition for the encoder power supply. Bit 2: Overcurrent condition for encoder power supply on cable resolver excitation negative. Bit 3: Overcurrent condition for encoder power supply on cable resolver excitation positive. Bit 4: The 24 V power supply through the Power Module (PM) is overloaded. Bit 5: Overcurrent at the EnDat connection of the converter. Bit 6: Overvoltage at the EnDat connection of the converter. Bit 7: Hardware fault at the EnDat connection of the converter. Note: If the encoder cables 6FX2002-2EQ00-.... and 6FX2002-2CH00-.... are interchanged, this can result in the encoder being destroyed because the pins of the operating voltage are reversed.

**Remedy:**

For fault value, bit 0 = 1:

- correct encoder cable connected?
- check the plug connections of the encoder cable.
- SMC30: Check the parameterization (p0404.22).

For fault value, bit 1 = 1:

- correct encoder cable connected?
- replace the encoder or encoder cable.

For fault value, bit 2 = 1:

- correct encoder cable connected?
- replace the encoder or encoder cable.

For fault value, bit 3 = 1:

- correct encoder cable connected?
- replace the encoder or encoder cable.

For fault value, bit 5 = 1:

- Measuring unit correctly connected at the converter?
- Replace the measuring unit or the cable to the measuring unit.

For fault value, bit 6, 7 = 1:

- Replace the defective EnDat 2.2 converter.

<b>A31400 (F, N)</b>	<b>Encoder 1: Zero mark distance error (alarm threshold exceeded)</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	DC_CTRL, DC_CTRL_R, DC_CTRL_R_S, DC_CTRL_S
<b>Component:</b>	Encoder 1 <b>Propagation:</b> LOCAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - replace the encoder or encoder cable.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Cause:** For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.  
For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.  
For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

**Remedy:** The fault should be resolved as follows:  
- select encoder commissioning (p0010 = 4).  
- reset the position tracking as follows (p0411.2 = 1).  
- deselect encoder commissioning (p0010 = 0).

- the firmware was updated to a version that checks the encoder serial number.

Note:  
With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).  
When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:  
- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.  
- parameterize F07414 as message type N (p2118, p2119).

**Remedy:**  
For causes 1, 2:  
Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.  
SERVO:  
If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.  
or  
Set the adjustment via p0431. In this case, the new serial number is automatically accepted.  
or  
Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.  
For causes 3, 4:  
Accept the new serial number with p0440 = 1.

### 4.2 List of faults and alarms

<b>Cause:</b>	The selected device combination is not supported. Fault value (r0949, interpret decimal): 1003: The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of $2^n$ . 1005: The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter. 1006: The maximum duration of the EnDat transfer (31.25 $\mu$ s) was exceeded. 2001: The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter. 2002: The resolution of the linear measuring unit does not match the pole pair width of the linear motor Pole pair width, minimum = $p0422 * 2^{20}$
<b>Remedy:</b>	For fault value = 1003, 1005, 1006: - Use a measuring unit that is permissible. For fault value = 2001: - set a permissible cycle combination (if required, use standard settings). For fault value = 2002: - Use a measuring unit with a lower resolution (p0422).

<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

<b>Cause:</b>	The signal level (root from $A^2 + B^2$ ) of the encoder is outside the permissible tolerance. Alarm value (r2124, interpret hexadecimal): yyyyxxxx hex: yyyy = Angle xxxx = amplitude, i.e. root of $A^2 + B^2$ (16 bits without sign) The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %). The response threshold is < 230 mV (observe the frequency response of the encoder). A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec. The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B. Note for Sensor Modules for resolvers (e.g. SMC10): The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms). A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec. Note: The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Cause:** For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.  
For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.  
For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

**Remedy:** The fault should be resolved as follows:  
- select encoder commissioning (p0010 = 4).  
- reset the position tracking as follows (p0411.2 = 1).  
- deselect encoder commissioning (p0010 = 0).  
The fault should then be acknowledged and the absolute encoder adjusted.

<b>Component:</b>	Encoder 2
<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE

<b>Cause:</b>	The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders). - the encoder was replaced. Note: With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2). When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1). Proceed as follows to hide serial number monitoring: - set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.
<b>Remedy:</b>	Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).

- check the electrical cabinet design and cable routing for EMC compliance

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

**Cause:** An error was identified in the encoder parameterization.  
 It is possible that the parameterized encoder type does not match the connected encoder.  
 The parameter involved can be determined as follows:  
 - determine the parameter number using the fault value (r0949).  
 - determine the parameter index (p0187).  
 Fault value (r0949, interpret decimal):  
 yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter  
 xxxx = 421:  
 For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.  
 yyyy = 0:  
 No additional information available.  
 yyyy = 1:  
 The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).  
 yyyy = 2:  
 A code number for an identified encoder has been entered into p0400, however, no identification was carried out.  
 Please start a new encoder identification.  
 yyyy = 3:  
 A code number for an identified encoder has been entered into p0400, however, no identification was carried out.  
 Please select a listed encoder in p0400 with a code number < 10000.  
 yyyy = 4:  
 This component does not support SSI encoders (p0404.9 = 1) without track A/B.  
 yyyy = 5:  
 For SQW encoder, value in p4686 greater than in p0425.  
 yyyy = 6:  
 DRIVE-CLiQ encoder cannot be used with this firmware version.  
 yyyy = 7:  
 For an SQW encoder, the XIST1 correction (p0437.2) is only permitted for equidistant zero marks.  
 yyyy = 8:  
 The motor pole pair width is not supported by the linear scale being used.

 The length of the position in the EnDat protocol may be a maximum of 32 bits.  
 yyyy = 10:  
 The connected encoder is not supported.  
 yyyy = 11:  
 The hardware does not support track monitoring.

**Remedy:**

- check whether the connected encoder type matches the encoder that has been parameterized.
- correct the parameter specified by the fault value (r0949) and p0187.
- re parameter number = 314:
- check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 \* p0433) / p0432 <= 1000).

**Component:** Terminal Module (TM) **Propagation:** BICO

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The signals output from the Terminal Module 41 (TM41) for tracks A/B have reached the limit frequency. The output signals are no longer in synchronism with the specified setpoint.

SIMOTION (p4400 = 0) operating mode:

- if the TM41 has been configured as the technology project, this fault is also output in response to short-circuited A/B signals in X520.

SINAMICS (p4400 = 1) operating mode:

- the fine resolution of TM41 in p0418 does not match that of the connector input that was interconnected at p4420
- the encoder position actual value r0479 interconnected at connector input p4420 has an excessively high actual speed
- the output signals correspond to a speed, which is greater than the maximum speed (r1082 of TM41).

**Remedy:** SIMOTION (p4400 = 0) operating mode:  
 - enter a lower speed setpoint (p1155).  
 - reduce the encoder pulse number (p0408).  
 - check track A/B for short-circuits.  
 SINAMICS (p4400 = 1) operating mode:

<b>Cause:</b>	For the temperature evaluation via the Terminal Module 150 (TM150), at least one of the following conditions to initiate this fault is fulfilled: - alarm threshold has been exceeded longer than that set in the timer (p4102[10], p4103[5]). or - fault threshold exceeded (p4102[11]). <b>Note:</b> For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[5] = 1, 4), the following applies: - if r4101[5] > 1650 ohms, the temperature r4105[5] = 250 °C - if r4101[5] <= 1650 ohms, the temperature r4105[5] = -50 °C The temperature actual value is displayed via connector output r4105[5] and can be interconnected. <b>Notice:</b> This fault only causes the drive to shut down if there is at least one BICO interconnection between the drive and the Terminal Module. Fault value (r0949, interpret decimal): Temperature actual value at the time of initiation [0.1 °C].
<b>Remedy:</b>	- allow the temperature sensor to cool down to below p4102[11] - hysteresis (p4118[5]). - if required, set the fault response to NONE (p2100, p2101). See also: p4102

#### **F36896 Hub DRIVE-CLiQ (CU): Inconsistent component properties**

**Message value:** Component number: %1  
**Message class:** Internal (DRIVE-CLiQ) communication error (12)  
**Drive object:** DC\_CTRL, DC\_CTRL\_R, DC\_CTRL\_R\_S, DC\_CTRL\_S, TM150, TM15DI\_DO, TM31  
**Component:** Terminal Board (TB) **Propagation:** LOCAL  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The properties of the DRIVE-CLiQ component (DRIVE-CLiQ Hub Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.  
Fault value (r0949, interpret decimal):  
Component number.  
**Remedy:** - carry out a POWER ON.  
- when a component is replaced, the same component type and if possible the same firmware version should be used.  
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

<b>F60010 (N, A)</b>	<b>Armature circuit uneven current distribution</b>

<b>Message class:</b>	Ground fault / inter-phase short-circuit detected (7)		
<b>Drive object:</b>	DC_CTRL		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2 (NONE)		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	An uneven current distribution through the thyristors has been identified in the armature circuit. Significantly less current flows in one thyristor than in the others. Remarks: - This monitoring is only effective if the average current value across all thyristors is greater than 20 % of r50072[1]. - The current in a thyristor is significantly lower, if, for a period of one second, the average value is less than 35 % of the average value across all thyristors. Possible causes: - A fuse has blown. - A thyristor is not fired (defective thyristor, defective pulse transformer, defective firing electronics). Fault value (r0949, interpret decimal): Number of the thyristor that is conducting the significantly lower current. Note: r50047[1]: Average current value through all armature thyristors. r50047[2]: Average current value through the thyristor with the excessively low current, in torque direction I. r50047[3]: Average current value through the thyristor with the excessively low current, in torque direction II. The current values as a % are referred to r50072[1]. Note: Even though the response to this fault message is set to "NO" when using p2100/p2101, or the message type set to "Alarm" or "No message" when using p2118/p2119, in the case of a fault, the drive still exits the OPERATION (RUN) state and goes into state o4.1 (wait for the fuse monitoring OK message.)		
<b>Remedy:</b>	- Check the fuses in the power unit. - If required, perform a thyristor diagnostics routine (p50830). See also: p50830 (Thyristor diagnostics mode)

**Cause:** The motor temperature is higher than the threshold set in p50491 to trigger this fault.  
Possible causes:  
- motor is overloaded.  
- Ambient temperature is too high  
Note:  
r50047[1]: Motor temperature (in °C) for temperature sensor with continuous characteristic.  
KTY84 (p50490 = 1) or

#### **A60032 (F, N) Motor temperature alarm**

**Message value:** -  
**Message class:** Motor overload (8)  
**Drive object:** DC\_CTRL  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** The motor temperature is higher than the threshold set in p50491 to trigger this alarm.

Possible causes:

- motor is overloaded.
- Ambient temperature is too high

Note:

PT1000 (p50490 = 8)

Otherwise the value = 0.

See also: p50491 (Motor interface alarm threshold for temperature monitoring)

**Remedy:**

- Check the threshold for triggering the alarm (p50491).
- Reduce the motor load if necessary.
- check the ambient temperature and reduce if necessary.

**Cause:** Inconsistent values have been set in parameters depending on each other.  
 Fault value (r0949, interpret decimal):  
 0: Field weakening active (p50081 = 1) is not permissible when the EMF is used as speed actual value (p50083 = 3).  
 1: Thyristor blocking voltage calculation active (p50166 = 1) for line frequencies > 65 Hz (p50364) is not permissible.  
 2: Setting of p51799 does not match the setting of p51800, p51802 and p51803.  
 3: For a line frequency > 65 Hz, p51800 must be < 10.  
 4: Setting of p50075 does not match the setting of p51799 (dynamic overload capability not permissible for single-phase operation).  
 5: Single-phase operation (p51799 = 1) not permissible for this device type.  
 6: Thyristor blocking voltage calculation (p50166 = 1) not possible for this device.  
 7: If p50083[D] = 2, p0400[0] = 0 is not permissible and if p50083[D] = 5, p0400[1] = 0 is not permissible.  
 8: For p50830 > 0, p51800 > 1 is not permissible, except 11 and 21 (thyristor diagnostics is only permissible for a single drive and for a parallel master).  
 9: For p50075 = 0, p50067 > 1 is not permissible.  
 10: Line frequency > 120 Hz is not permissible for this power unit (p50364).  
 11: For a 12-pulse parallel connection (p51800 = 21 .. 24) p50153 = 2 is only permissible, if p51799 = 22.  
 12: Parameter p51801 (number of send data) has not been set high enough.  
 p51801 must be set high enough at all devices so that all BICOs selected with p51804 or p51814 (i.e. with parameter value <> 0) are transferred.  
 The configuration of all connected devices is checked. The device that outputs the fault signal is not necessarily the device with the incorrect parameterization.  
 14: p51401 = 2 is only permissible for DCM Control Modules or for devices with option L30.  
 21: If, at a device, p51800 is set > 10, then for all other devices it is not permissible that p51800 is set = 0 or 1.  
 22: If, at a device, p51800 is set > 10, then one device must be parameterized as master (p51800 = 11, 13, 21, 23, 31, 33, 35, 41, 43 or 45).  
 23: It is only permissible to set p51800 = 11 at one device. At all other devices, it is only permissible that p51800 is set = 0, 1, 12 or 13. p51800 must be set = 12 or 13 at least one device.  
 24: p51800 must be set = 21 and 23 at each device. At all other devices, it is only permissible that p51800 is set = 0, 1, 22 or 24.  
 25: p51800 must be set = 31 and 33 at each device. At all other devices, it is only permissible that p51800 is set = 0, 1, 32 or 34.  
 26: It is only permissible to set p51800 = 35 at one device. At all other devices, it is only permissible that p51800 is set = 0 or 1.  
 27: p51800 must be set = 41 and 43 at each device. At all other devices, it is only permissible that p51800 is set = 0, 1, 42 or 44.  
 28: It is only permissible to set p51800 = 45 at one device. At all other devices, it is only permissible that p51800 is set = 0 or 1.

Fault value (r0949, interpret decimal):

- 1: Thyristor defective (V11 and/or V24)
- 2: Thyristor defective (V12 and/or V25)
- 3: Thyristor defective (V13 and/or V26)

- 29: Two or more thyristors from V11 ... V26 cannot be fired (same firing pulse path)
- 31: Thyristor cannot block (V11 or V21)
- 32: Thyristor cannot block (V12 or V22)
- 33: Thyristor cannot block (V13 or V23)
- 34: Thyristor cannot block (V14 or V24)
- 35: Thyristor cannot block (V15 or V25)
- 36: Thyristor cannot block (V16 or V26)
- 41: Thyristor cannot be fired (V11 or V16)
- 42: Thyristor cannot be fired (V13 or V14)
- 45: Thyristor cannot be fired (V21 or V26)
- 46: Thyristor cannot be fired (V23 or V24)
- 99: Defective thyristor cannot be identified

Note 1:

If "Thyristor defective" or "Thyristor cannot block" is signaled, then the corresponding thyristor module should be replaced.

Possible reasons why thyristors could be destroyed:

- Interrupted snubber circuit.
- Current controller and precontrol not optimized (excessively high current peaks).
- Cooling not guaranteed (e.g. a fan is not running, ambient temperature too high, incorrect fan direction of rotation (incorrect rotating field), air flow too low, very dirty heat sink).
- Excessively high voltage peaks in the line supply.
- External short-circuit or ground fault present (check the armature circuit).

Note 2:

If "Fault in the firing pulse cable" is signaled, then this is generally caused by a fault in the firing circuit.

Possible causes:

- Firing pulse cable to the thyristor involved interrupted.
- Connector X11 or X21 incorrectly inserted.
- Flat cable X108 either not correctly inserted or interrupted.
- Defective electronics module or gating module.

Note 3:

If "Thyristor cannot be fired" is signaled, then the gate conductor in the thyristor module is probably

broken/interrupted.

Note 4:

For a Control Module, this fault can also be initiated by other fault causes.

- Incorrect assignment of the firing pulses to the thyristors.
- Incorrect current actual value sensing connection.
- Incorrect parameterization of the current actual value sensing (p51822, p51823, p51824).
- Incorrect parameterization of the power unit type (p51825).

Note for fault value = 28:

At least one thyristor of bridge 1 and at least one thyristor of bridge 2 cannot be fired.

The thyristors that cannot be fired are controlled via different firing pulse paths.

Note for fault value = 29:

At least one thyristor of bridge 1 and at least one thyristor of bridge 2 cannot be fired.

The thyristors that cannot be fired are controlled via the same firing pulse path.

Therefore, it is possible that either the firing pulse cable or the gating module is defective.

Note 5:

The supplementary information on the fault messages supplies the following information:

r50047[1] to r50047[4] provide data on the last event that was detected to be faulty by the short-circuit test:

r50047[1]; thyristor code

Bit 0 .. 5 = 1 means: thyristor 1 .. 6 was fired

Bit 6 = 1 means: thyristor in bridge I was fired

Bit 7 = 1 means: thyristor in bridge II was fired

r50047[20]: current that flowed in thyristor pair 6-5 in bridge II

+1.00 .. 100% of r50072[1] (rated current)

r50047[21] and r50047[22] indicate how quickly the firing angle was changed during the test:

r50047[21]: firing angle change per firing pulse for the short circuit test (+1.00 .. +90°)

r50047[22]: firing angle change per firing pulse for the conductivity test (+1.00 .. +90°)

**Remedy:**

Interpret the fault value and information and replace the appropriate thyristor.

**Message class:** Network fault (2)  
**Drive object:** DC\_CTRL  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2 (NONE)  
**Acknowledge:** IMMEDIATELY  
**Cause:** On power up, the time set in p50089 represents the maximum wait time for voltage at the power connections and for field current in operating states o5 and o4 combined.  
On power up, the time set in p50095 represents the maximum wait time for "Line contactor feedback" in operating state o3.3 (if activated, see p50691).  
This fault is triggered if the above times elapse in one of these operating states.

- Thresholds for the line monitoring incorrectly set (p50078, p50351, p50352, p50353, p50363, p50364).
- Armature voltage not OK (phase failure, undervoltage/overvoltage, underfrequency/overfrequency).
- Line contactor not picking up
- Fuse blown on three-phase side of armature circuit
- Fuse blown in power unit
- Interruption affecting thyristor firing pulse cable (auxiliary cathodes at connections X12, X14, X16 are used for voltage transmission).

Fault value (r0949, interpret decimal):  
2: Wait time set in p50089 has expired in operating state o4.0.

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** Field current monitoring has detected erroneous behavior.

- Field phase failed
  - Line contactor not picking up
  - Fuse blown in field circuit
  - Field current controller and/or field current controller pre-control not optimized or optimization is very poor.
- Fault value (r0949, interpret decimal):
- 1: The field current actual value was smaller than the percentage of the field current setpoint set in p50396.
  - 2: The field line voltage was not available within the time set in p50089.

## A.1 ASCII table (characters that can be displayed)

The following table includes the decimal and hexadecimal notation of ASCII characters that can be displayed (printable).

Table A-1 ASCII table (characters that can be displayed)

Character	Decimal	Hexadecimal	Meaning
	32	20	Space
!	33	21	Exclamation mark
"	34	22	Quotation mark
#	35	23	Number sign
\$	36	24	Dollar
%	37	25	Percent
&	38	26	Ampersand
'	39	27	Apostrophe, closing single quotation mark
(	40	28	Opening parenthesis
)	41	29	Closing parenthesis
*	42	2A	Asterisk
+	43	2B	Plus
,	44	2C	Comma
-	45	2D	Hyphen, minus
.	46	2E	Period, decimal point
/	47	2F	Slash, slant
0	48	30	Digit 0
1	49	31	Digit 1
2	50	32	Digit 2
3	51	33	Digit 3
4	52	34	Digit 4
5	53	35	Digit 5
6	54	36	Digit 6
7	55	37	Digit 7
8	56	38	Digit 8
9	57	39	Digit 9

## A.2 List of abbreviations

---

### Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

---

Abbreviation	Derivation of abbreviation	Significance
<b>A</b>		
A...	Alarm	Warning
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short-Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American coding standard for the exchange of information
AS-i	AS-Interface (Actuator Sensor Interface)	AS-Interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
AVS	Active Vibration Suppression	Active load vibration damping
<b>B</b>		
BB	Betriebsbedingung	Operation condition
BERO	-	Contactless proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
<b>C</b>		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system
CBC	Communication Board CAN	Communication Board CAN
CBE	Communication Board Ethernet	PROFINET communication module (Ethernet)
CD	Compact Disc	Compact disc
CDS	Command Data Set	Command data set
CF Card	CompactFlash Card	CompactFlash card

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
CI	Connector Input	Connector input
CLC	Clearance Control	Clearance control
CNC	Computerized Numerical Control	Computer-supported numerical control
CO	Connector Output	Connector output
CO/BO	Connector Output/Binector Output	Connector output/Binector output
COB-ID	CAN Object-Identification	CAN object identification
CoL	Certificate of License	Certificate of License
COM	Common contact of a change-over relay	Center contact of a changeover contact
COMM	Commissioning	Startup
CP	Communication Processor	Communication processor
CPU	Central Processing Unit	Central processing unit
CRC	Cyclic Redundancy Check	Cyclic redundancy check
CSM	Control Supply Module	Control Supply Module
CU	Control Unit	Control Unit
CUA	Control Unit Adapter	Control Unit Adapter
CUD	Control Unit DC	Control Unit DC
<b>D</b>		
DAC	Digital Analog Converter	Digital analog converter
DC	Direct Current	DC current
DCB	Drive Control Block	Drive Control Block
DCBRK	DC Brake	DC braking
DCC	Drive Control Chart	Drive Control Chart
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDC	Dynamic Drive Control	Dynamic Drive Control
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input/Digital Output	Digital input/output, bidirectional
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed I/O
DPRAM	Dual Ported Random Access Memory	Dual-Port Random Access Memory
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic Random Access Memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
DSM	Doppelsubmodul	Double submodule
DTC	Digital Time Clock	Timer

Abbreviation	Derivation of abbreviation	Significance
<b>E</b>		
EASC	External Armature Short-Circuit	External armature short-circuit
EDS	Encoder Data Set	Encoder data set
EEPROM	Electrically Erasable Programmable Read-Only Memory	Electrically Erasable Programmable Read-Only-Memory
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatically sensitive devices
EIP	EtherNet/IP	EtherNet Industrial Protocol (realtime Ethernet)
ELCB	Earth Leakage Circuit Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder-Data-Interface	Encoder interface
EP	Enable Pulses	Pulse enable
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering system
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Elektrostatisch gefährdete Baugruppen
ESM	Essential Service Mode	Essential service mode
ESR	Extended Stop and Retract	Extended stop and retract
<b>F</b>		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBLOCKS	Free Blocks	Free function blocks
FCC	Function Control Chart	Function Control Chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Failsafe Digital Input	Fail-safe digital input
F-DO	Failsafe Digital Output	Fail-safe digital output
FEPRM	Flash-EPROM	Non-volatile write and read memory
FG	Function Generator	Function generator
FI	-	Fault current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field Programmable Gate Array
FW	Firmware	Firmware
<b>G</b>		
GB	Gigabyte	Gigabyte
GC	Global Control	Global control telegram (broadcast telegram)

Abbreviation	Derivation of abbreviation	Significance
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as M)
GSD	Gerätstammdatei	Generic Station Description: Describes the features of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate supply voltage
GUID	Globally Unique Identifier	Globally Unique Identifier
<b>H</b>		
HF	High frequency	High frequency
HFD	Hochfrequenzdrossel	Radio frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear actuator
HLG	Hochlaufgeber	Ramp-function generator
HM	Hydraulic Module	Hydraulic Module
HMI	Human Machine Interface	Human Machine Interface
HTL	High-Threshold Logic	Logic with high interference threshold
HW	Hardware	Hardware
<b>I</b>		
i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Startup
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
<b>J</b>		
JOG	Jogging	Jogging
<b>K</b>		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-how protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor

Abbreviation	Derivation of abbreviation	Significance
<b>L</b>		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
<b>M</b>		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
<b>N</b>		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Interessengemeinschaft Automatisierungstechnik der Prozessindustrie	User Association of Automation Technology in Process Industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization association in USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NTP	Network Time Protocol	Standard for synchronization of the time of day
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory

Abbreviation	Derivation of abbreviation	Significance
<b>O</b>		
OA	Open Architecture	Software component which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware as of which the OA-application can be used
OASP	Open Architecture Support Package	Extends the commissioning tool to include the corresponding OA-application
OC	Operating Condition	Operation condition
OCC	One Cable Connection	One-cable technology
OEM	Original Equipment Manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
<b>P</b>		
p...	-	Adjustable parameters
P1	Processor 1	Processor 1
P2	Processor 2	Processor 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDC	Precision Drive Control	Precision Drive Control
PDS	Power unit Data Set	Power unit data set
PDS	Power Drive System	Drive system
PE	Protective Earth	Protective ground
PELV	Protective Extra Low Voltage	Safety extra-low voltage
PFH	Probability of dangerous failure per hour	Probability of dangerous failure per hour
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logical Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PM	Power Module	Power Module
PMI	Power Module Interface	Power Module Interface
PMSM	Permanent-magnet synchronous motor	Permanent-magnet synchronous motor
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point to Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PT1000	-	Temperature sensor
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point To Point	Point-to-point

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
<b>Q</b>		
<b>R</b>		
r...	-	Display parameters (read only)
RAM	Random Access Memory	Memory for reading and writing
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
REL	Reluctance motor textile	Reluctance motor textile
RESM	Reluctance synchronous motor	Synchronous reluctance motor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for a cable-connected serial data transmission between a transmitter and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of transmitters and receivers, also known as EIA485)
RTC	Real Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space-vector approximation
<b>S</b>		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SCC	Safety Control Channel	Safety Control Channel
SCSE	Single Channel Safety Encoder	Single-channel safety encoder
SD Card	SecureDigital Card	Secure digital memory card
SDC	Standard Drive Control	Standard Drive Control
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
SESM	Separately-excited synchronous motor	Separately excited synchronous motor
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe stop
SI	Safety Integrated	Safety Integrated
SIC	Safety Info Channel	Safety Info Channel
SIL	Safety Integrity Level	Safety integrity level
SITOP	-	Siemens power supply system
SLA	Safely-Limited Acceleration	Safety limited acceleration
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely-limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Sensorless vector control
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	SINAMICS Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe Stop 1 (time-monitored, ramp-monitored)
SS1E	Safe Stop 1 External	Safe Stop 1 with external stop
SS2	Safe Stop 2	Safe Stop 2
SS2E	Safe Stop 2 External	Safe Stop 2 with external stop
SSI	Synchronous Serial Interface	Synchronous serial interface
SSL	Secure Sockets Layer	Encryption protocol for secure data transfer (new TLS)
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
<b>T</b>		
TB	Terminal Board	Terminal Board
TEC	Technology Extension	Software component which is installed as an additional technology package and which expands the functionality of SINAMICS (previously OA-application)

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
TIA	Totally Integrated Automation	Totally Integrated Automation
TLS	Transport Layer Security	Encryption protocol for secure data transfer (previously SSL)
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral time
TPDO	Transmit Process Data Object	Transmit Process Data Object
TSN	Time-Sensitive Networking	Time-Sensitive Networking
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor-Logic	Transistor-transistor logic
Tv	-	Rate time
<b>U</b>		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
<b>V</b>		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage negative
VdcP	-	Partial DC-link voltage positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
<b>W</b>		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
<b>X</b>		
XML	Extensible Markup Language	Extensible markup language (standard language for Web publishing and document management)
<b>Y</b>		
<b>Z</b>		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status word
