Min:	**Max:**	**Factory setting:**
0.0 [ms]	60.0 [ms]	7.5 [ms]

Description: Sets the time constant for the precontrol symmetrization for online tuning / One Button Tuning.

As a consequence, the drive is allocated a defined, dynamic response via its precontrol.

For axes, which must interpolate with one another, the same value must be entered.

Examples:

0 ms = travel without following error (Kv factor is infinity)

5 ms = settling behavior as for PT1 with 5 ms (Kv factor = 12 [1000/min])

Dependency: See also: p5271, p5272, p5273, r5274

Note: This time constant is only effective if p5302.7 is set = 1.

Otherwise, the precontrol symmetrization is adapted to the estimated dynamic response, therefore setting positioning without any overshoot.

Dependency: See also: p5271, p5272, p5273, p5275

Warning: The calculation assumes that the DSC is activated in the drive and is controlled on the motor measuring system.
If this is not the case, then excessively high values are displayed.
The value that is displayed does not take into account low-frequency resonance effects in the drive train. If necessary, the value must be significantly reduced.

Note: The value for the closed-loop position control is required by a higher-level control system.

Min:	**Max:**	**Factory setting:**

Description: Sets the configuration for the adaptive current setpoint filter.
The adaptation acts on the filter set using p5281.

Value:
-1: Inactive and filter deactivated
0: Inactive
1: Active

Dependency: The prerequisite for the adaptation of the current setpoint filter is that the "Moment of inertia estimator" function module is activated (r0108.10).
See also: p5281, p5282, p5283, p5284, r5285

Notice: If, when activating adaptation (p5280 = 1), the filter assigned via p5281 is still not active, then it is automatically activated.

Note: If p5280 = -1:
The adaptation is deactivated and the assigned filter deactivated.
If p5280 = 0:
The adaptation is inactive. The actual setting of the filter parameters is kept in a volatile memory. To permanently save the values that have been determined, the parameters must be saved in a non-volatile memory (p0977 = 1).
If p5280 = 1:
The adaptation is active. When a mechanical resonant frequency is excited, the filter frequency is adapted. Adaptation is temporarily inactive while the function generator generates a noise signal (p4820 = 4).

Description: Sets the lower limit frequency for the current setpoint filter adaptation.
If the actual frequency of the adapted filter falls below the lower limit frequency, then the frequency of the adapted filter is set to the lower limit frequency. This limit is only effective when adaptation is active (p5280 = 1). If adaptation is not active, then this limit only becomes effective at the time of the next activation.

Dependency: See also: p5280, p5281, p5283, p5284, r5285

Note: If a value is entered which exceeds the upper limit frequency (p5283), then the value is rejected.

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
200 [Hz]	10000 [Hz]	1500 [Hz]

Description: Sets the upper limit frequency for the current setpoint filter adaptation.

If the actual frequency of the adapted filter exceeds the upper limit frequency, then the frequency of the adapted filter is set to the upper limit frequency. This limit is only effective when adaptation is active (p5280 = 1). If adaptation is not active, then this limit only becomes effective at the time of the next activation.

There is an internal maximum value for the upper limit frequency; this depends on the damping (attenuation) of the adapted filter and the current controller sampling time.

If the parameterized value exceeds the internal maximum value, then the following applies:

- this parameter is immediately limited to the internal maximum value if adaptation is active.
- this parameter is limited to the internal maximum value the next time that adaptation is activated (p5280).

Dependency: See also: p5280, p5281, p5282, p5284, r5285

Note: If a value is entered which falls below the lower limit frequency (p5282), then the value is rejected.

Note: The value should be increased if, in operation, the filter frequency continuously changes significantly although the resonance frequency does not change.

The value should be reduced if the filter frequency adaptation cannot be set so that mechanical resonance is suppressed.

Dependency: See also: r5293, r5294, r5295, p5296, p5297

Note: HF: high frequency

LF: low frequency

For bit 00:

A PRBS signal (pseudo random binary signal) is superimposed on the current setpoint to be able to better identify the mechanical controlled system.

For bit 01:

The identified mechanical resonance points are suppressed using current setpoint filters.

For bit 02:

The maximum velocity controller gain is determined from the identified mechanical controlled system.

For bits 03, 04:

The measured value buffer length is set using these bits:

Bit 04 = 0 and bit 03 = 0 -> buffer length = 256

Bit 04 = 0 and bit 03 = 1 -> buffer length = 512

Bit 04 = 1 and bit 03 = 0 -> buffer length = 1024

Bit 04 = 1 and bit 03 = 1 -> buffer length = 2048

For bit 05:

A Hamming window is used to filter the measured time signals.

For bit 06:

The measurement checks the current controller frequency characteristic. For high amplitudes in p5298, it is possible that the check is unsuccessful, as the converter reaches its voltage limit.

For bits 07, 08:

An aliasing filter is used for the measured values.

Bit 08 = 0 and bit 07 = 0 -> filter frequency = 50 Hz

Bit 08 = 0 and bit 07 = 1 -> filter frequency = 100 Hz

Bit 08 = 1 and bit 07 = 0 -> filter frequency = 200 Hz

Bit 08 = 1 and bit 07 = 1 -> filter frequency = 400 Hz

For bit 09:

Evaluation can be switched over from correlation to differential filter.

For bits 10, 11:

Number of measuring periods.

Bit 11 = 0 and bit 10 = 0 -> number of measurements = 1

Bit 11 = 0 and bit 10 = 1 -> number of measurements = 2

Bit 11 = 1 and bit 10 = 0 -> number of measurements = 4

Bit 11 = 1 and bit 10 = 1 -> number of measurements = 8

For bit 12:

The PRBS signal is switched to the velocity setpoint (in front of the filter).

For bit 13:

The input signal for the force actual value is taken from in front of the current setpoints filters.

When the bit is set, a current setpoint filter is used to partially compensate the mechanical system.

This is recommended for the following machine attributes:

- the load moment of inertia is significantly higher than the motor moment of inertia (e.g. > 6x).
- the coupling between the machine elements has almost no backlash (no play).
- the stiffness of the mechanical transmission elements does not change significantly in the traversing range.

Description: Setting the motor velocity offset.

The offset is intended to prevent non-linear effects, such as backlash or stiction from influencing the measured values

Recommendation: If the "Identify high frequencies" function (p5290 = 1) is used together with a TTL/HTL encoder, then the following applies to the offset velocity (p5297):

p5297 > 15 / motor encoder pulse number / velocity controller sampling time

p5297 = 15 / p0408 / p0115[2]

Description: Amplitude response of the speed control loop in dB (units rpm/Nm or m/min/N).

During the One Button Tuning function, 1024 measured values are generated, and are then output in the speed controller sampling time.

For p5301.0 = 1 or p5301.1 = 1, in the representation, a measured value corresponds to (1/p0115[1])/2048 in [Hz].

For p5301.4 = 1 or p5301.5 = 1 in the representation, a measured value corresponds to 250/2048 in [Hz].

A trigger condition is required to trace the measured values (e.g. amplitude response r5298 <> 0).

Sets activation/deactivation of the "auto tuning" function.
If p5300 = 1:
The "One button tuning" function is configured using p5301.
If p5300 = 2:
The "Online tuning" function is configured using p5302.
The following parameters are written to for the two functions:
p0430, p1160, p1400, p1413 - p1426, p1428, p1429, p1433 - p1435, p1441, p1460 - p1465, p1498, p1513, p1656 - p1676, p2533 - p2539, p2567, p2572, p2573, p5280

Value:
-1: Reset controller parameters
0: Inactive
1: One Button Tuning
2: Online tuning

Dependency:
The prerequisite for the "auto tuning" function is that the "Moment of inertia estimator" function module is activated (r0108.10).
The "Autotuning" function can only be selected for "Servo" control mode with position encoder.
The motor must have already been commissioned so that autotuning functions error-free. A motor identification may be necessary beforehand (p1900 and following).
One Button Tuning:
p5301 configures the "One Button Tuning" function.
p5292 if the required dynamic response of the control loops is set.
p5308 is used to parameterize the traversing distance for the test signal.
Other relevant parameters: p5309, p5296, p5297, p5275, r5274, r5393, r5394, r5395
Online tuning:
p5302 configures the "Online tuning" function.
p5272 if the required dynamic response of the control loops is set.
Other relevant parameters: p5271, p5275, r5274
See also: p5271, p5272, p5273, r5274, p5275, p5292, r5293, r5294, r5295, p5296, p5297, p5301, p5302, p5308, p5309

Warning:

Only the motor measuring system is taken into account when optimizing the position controller. If an external measuring system is used for the position control, then this can result in an unstable controller setting.
The "One Button Tuning" function does not support different sampling times for current and velocity controllers. For p0112 =2, in some instances different stability criteria are obtained. It is recommended that "One Button Tuning" is not used for this configuration.

Caution: For some drive trains, the "online tuning" function can result in unstable settings (motor makes a whistling sound). This is especially the case for large load masses that are connected to the motor through a low-frequency coupling/connection. In this case, parameter p5272 or p5273 must be reduced.

Notice: When executing One Button Tuning, the motor can be accelerated with its rated torque if the torque limit (p1520, p1521) does not limit this to lower values. If the mechanical system is sensitive, then it is recommended that the torque limits are appropriately reduced before executing One Button Tuning.

Note: If p5300 = -1:

Autotuning is deactivated, and p5300 is automatically set to 0. In addition, the default setting values for the velocity and position controller are restored.

If p5300 = 0:

Online tuning is inactive.

To permanently back up the values determined for the velocity controller and position controller, the parameters must be saved in a non-volatile fashion (p0977 = 1 or "Copy RAM to ROM").

The results of the moment of inertia estimator can be reset using p5300 = 0. After p5300 > 0, the parameters for moment of inertia and tuning must be determined again.

If p5300 = 1:

One Button Tuning is active.

The mass is determined once using a test signal. The controller parameters and current setpoint filters are additionally determined once using a noise signal as excitation source.

If p5300 = 2:

Online tuning is active.

The mass is estimated. The controller parameters are recalculated if the mass noticeably changes.

For bit 01:

Possibly required current setpoint filters are determined and set using a noise signal.

As a consequence, a higher dynamic performance can be achieved in the speed control loop.

For bit 02:

When the bit is set, the moment of inertia is determined using a test signal via the moment of inertia estimator. If this bit is not set, then the load moment of inertia must be manually set using parameter p1498. The test signal must have been previously set using parameters p5308 and p5309.

For bit 04:

Using this bit, load oscillation detection is determined using a test signal. The traversing path must first be set using parameter p5308.

For bit 05:

Using this bit, load oscillation detection is determined using a test signal, and transferred to p3752. The precondition is function module "APC" (r0108.7 = 1) and p3700.2 = 1. After executing the function, APC must be activated via p3700.0 = 1. The traversing path must first be set using parameter p5308.

With this function, these axes are adapted to the dynamic response set in p5275. This is necessary for interpolating axes. The time in p5275 should be set according to the axis with the lowest dynamic response.

For bit 08:

Using this bit, the moment of inertia is determined from the frequency characteristic using a test signal. If bit 02 is inactive, then the moment of inertia is also transferred to p1498. The traversing path for the measurement can be set beforehand using parameter p5308. This is recommended in order to be able determine a more accurate moment of inertia. The frequency range for the measurement can be restricted using parameters p5323 and p5324.

Note: For bit 02:

When the bit is set, the mass is determined while traversing (moment of inertia estimator). If this bit is not set, then the load mass must be manually set using parameter p1498.

If p5302.3 = 0, "Once" applies:

After having successfully determined the load mass (p1498), the moment of inertia estimator is deactivated.

If p5302.3 = 1, "Cyclic" applies:

The mass is continually determined and the controller parameters adapted. After the mass has been successfully determined (r1407.26 = 1), we recommend that the parameters are saved in a non-volatile fashion. As a consequence, the controllers do not have to restabilize after the next switch on.

For bit 06:

Description: Setting to activate the test signal.

For bit 01:

As setpoint speed, a triangular signal is entered, alternating in the positive and negative directions. Distance p5308 and duration p5309 are kept.

This function is used for One Button Tuning p5300 = 1.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
01	Triangular test signal	ON	OFF	-

Dependency: See also: p5308, p5309

Note: For bit 01:

This test signal can only be activated for p5308 > 0 and p5309 > 0.

Speed control with encoder is required to activate the test signal.

Dependency: The function module "Moment of inertia estimator" (r0108.10) must be activated for the "Moment of inertia precontrol" function.
See also: r5311, p5312, p5313, p5314, p5315

Note: Possible bit combinations:
Bit 1, 0
= 0, 0 --> function not active
= 0, 1 --> cyclic calculation of the coefficients without moment of inertia precontrol (commissioning)
= 1, 0 --> moment of inertia precontrol activated (without cyclic calculation of the coefficients)
= 1, 1 --> moment of inertia precontrol activated (with cyclic calculation of the coefficients)
For bit 00:
Calculation for the constant and linear coefficients of the moment of inertia precontrol is activated. The results are written to parameters (p5312, p5313, p5314, p5315).
For bit 01:
The moment of inertia precontrol is activated.
The moment of inertia is calculated from the currently measured load torque and the saved coefficients (p5312, p5313, p5314, p5315).

Description: Sets the boost factor for the copper losses at standstill for motor temperature models 1 and 3.
The entered factor is active for speed n = 0 [rpm].
This factor is linearly reduced down to 1 between speeds n = 0 ... 1 [rpm].
The following values are required to calculate the boost factor:
- stall current (I_0, p0318, catalog value)
- thermal stall current (I_th0, catalog value)
The boost factor is calculated as follows:
- p5350 = (I_0 / I_th0)^2

Dependency: See also: p0318, p0351, p0612, p5390, p5391
See also: F07011, A07012, F07013, A07014

Notice: When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

Note: Temperature model 1 (I2t):
The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:
- parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.
The following applies from firmware version 4.7 SP6 and p0612.8 = 1:
- parameter p5350 becomes active as described above.

Description: Display and connector output for the remaining time until a fault is output due to motor overtemperature.
With the motor load remaining the same, the values specify the time remaining until a fault is output.
For index [0]:
The value indicates the active remaining time until a fault is output.
This value is the minimum from indices [1] to [4]; whereby, value -1 is not taken into account.
For index [1]:
The value indicates the calculated time that remains until a fault is output for the model.
For index [2]:
The value indicates the time that remains until a fault is output after an alarm has occurred for the model (p0605, p5387).
For index [3]:
The value indicates the calculated time that remains until a fault is output for the measurement.
For index [4]:
The value indicates the time that remains until a fault is output after an alarm has occurred for the measurement (p0606).

Index: [0] = Active time
[1] = Thermal time according to the model-based calculation
[2] = Timer time after alarm from the model
[3] = Thermal time after calculation from the measurement
[4] = Timer time after alarm from the measurement

Note: Value = 120 s means that there is no thermal restriction.
Value = -1 s means that a prediction is not possible.

Note: For bit 00, 04:

The motor temperature is measured using a temperature sensor (p0600, p0601). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 01, 05:

The motor temperature is monitored based on a temperature model (p0612). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 02:

The encoder temperature is measured using a temperature sensor. When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 03, 07:

The motor load is monitored using the additional motor overload protection (p0612.13). When the bit is set, an excessive load has been identified and a corresponding signal is also output.

For bit 08:

When reaching the motor temperature alarm threshold, reduction of the maximum current is set as response (p0610 = 1). When the bit is set, reduction of the maximum current is active.

Description: Sets the configuration for the line droop control.
Recommendation: We recommend that the factory setting is kept.
Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	Q-U droop	Yes	No	-
01	dq transformation with grid droop angle	Yes	No	-

Dependency: See also: r5412, r5421, r5422, r5449

Note: For bit 00:

For p5400.0 = 0, the reactive current (r5421) is used as input variable for the voltage droop (r5420).

Using this reactive current voltage droop, also in the case of line/grid voltage dips, a stable operating point for common operation with additional power generators in the island grid is obtained. This is also true if these generating units employ a reactive power voltage droop.

For p5400.0 = 1, the reactive power (r5422) is used as input variable for the voltage droop (r5420), therefore implementing a reactive power-voltage droop functionality.

For bit 01:

For p5400.1 = 0, the line angle from the transformer model and PLL (r0094) are used to calculate the active current and reactive current (r5421, r5449).

For p5400.1 = 1, the grid supply angle from the grid supply droop (r5412) is used to calculate the active and reactive current (r5421, r5449).

BI: p5401[1] = 1 signal:

Activates the setpoints.

BI: p5401[1] = 0 signal:

Deactivates the setpoints.

Index: [0] = Line regulation
[1] = Droop setpoints

Dependency: For p5401[0], the following applies:

The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source.

See also: r5402

Notice: Line droop control can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

We urgently recommend at least one measure to dampen power oscillations (p5413, p5476) if, in an island grid, several generating sources are simultaneously active – and power is exchanged via the frequency droop (p5405).

Note: For index [0]:

So that closed-loop DC link voltage control is activated by the VECTOR drive object's technology controller (due to closed-loop DC link voltage control for the infeed being deactivated) the following BICO interconnection must be set:

BI: p3513 (VECTOR) = r5402.0 (A_INF)

For index [1]:

When the setpoints are deactivated, the smoothed actual values of these variables are used for the no-load values of frequency and voltage. As a consequence, the average power is controlled so that it approaches zero. However, when the line frequency or line voltage changes, brief peak powers can occur according to the current limits that have been set (r5479).

As the power is controlled to zero, in island grids continuous operation is only possible with p5401[1] = 0 if the grid is supplied by other generating units. Otherwise, line frequency and line voltage decreases to the shutdown limits. However, brief exceptions with the appropriate low frequency and amplitude deviations are possible and make sense (e.g. for switchover transitions in hot standby applications).

Description: Sets the signal source for the frequency droop supplementary setpoint (as a % of p0211).
Index: [0] = Supplementary setpoint is smoothed
[1] = Supplementary setpoint direct
Dependency: See also: p5405
Notice: For index [1]:
Setpoint steps without smoothing can result in significant equalization operations in the line supply and the overload of the inverter and the line components.
Note: For index [0]:
The setpoint signals are smoothed using a PT1 filter (p5409).
For index [1]:
If the signals for the unsmoothed setpoints are precisely reset to 0 (e.g. for p5483[3] = 1), then by internally adapting the smoothed setpoint state, an undesirable step-like frequency change is avoided. The signal for the smoothed setpoint should be adapted using a corresponding frequency change, if the frequency is to be kept constant.

Description: Sets the gradient for the additional, fast frequency droop.
The reference quantity is the gradient for the regular frequency droop (p5407).
The settings for the regular frequency droop (p5405 onwards) apply to the other droop parameters.
As a result of the short smoothing time, the supplementary frequency droop acts similar to a D component – and therefore as damping factor for the closed-loop line control.

Recommendation: Typical setting values lie between 50 % and 100 %.

Dependency: See also: p5414, p5476

Note: For example, a strong frequency dip can be generated when the load is connected with the additional frequency droop, and this can be used to emulate the behavior of a diesel generator.
The frequency is initially changed with the smoothing time p5414 in accordance with the additional droop, reaching the stationary end value in accordance with the time constant p5409 for the regular frequency droop.
The additional droop is deactivated with p5413 = 0.

Description: Sets the no-load voltage for the voltage droop and grid droop control.
This value is entered as a % referred to the device supply voltage (p0210)
Using the voltage droop, the currently required output voltage can be calculated for stable grid operation.
The no-load voltage is defined as the setpoint output voltage for the case that the reactive current or the reactive power at the selected connection point (p5403, p5404) assumes a value of 0.

Dependency: See also: p5419

Note: For the reactive current voltage droop (p5400.0 = 0), the following applies:
The droop characteristic input variable is the reactive power r5421[0] at the selected connection point (p5403, p5404).
The following droop formula applies without taking into account smoothing:
r5420 = (p5415 + p5416 + p5417 * r5421[0] / r0207) * p0210
The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.
For the reactive power voltage droop (p5400.0 = 1), the following applies:
The input variable of the droop characteristic is the reactive power (r5422[0]) at the selected connection point (p5403, p5404).
The following droop formula applies without taking into account smoothing:
p5420 = (p5415 + p5416 - p5417 * r5422[0] / (1.732 * r0207 * p0210)) * p0210
The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.

Description: Sets the parameters for rapid precontrol of the output voltage in the event of a voltage dip.

The values relate to the voltage setpoint from the voltage droop (r5420).

The voltage output by the converter is formed from the product of the voltage setpoint and the adaptation factor, which is calculated in rapid precontrol.

Index: [0] = Adaptation factor lower limit
[1] = Adaptation factor increment current limit
[2] = Adaptation factor increment voltage difference
[3] = Adaptation factor increment increase

Dependency: See also: r5452

Note: Rapid adaptation of the voltage setpoint to a reduced line voltage (e.g. in the event of a line short circuit) reduces the number of additional switching operations completed by the lower-level rapid current hysteresis controller.

For index [0]:

Minimum value for the adaptation factor, must be complied with for the calculation of the reduced output voltage. The factory setting is appropriate if the inductance of the commutating reactor (p0223) has the value p3421 - p3424.

Higher values for p5428[0] result in higher rms values of the currents in the case of a short circuit. However, current limiting also intervenes more – and more harmonics are generated.

For excessively low values in p5428[0], the short-circuit displayed in r5479[1] is no longer reached.

The function is deactivated with p5428[0] = 100 %.

For index [1]:

When the current limit is reached, the adaptation factor is weighted with this factor in each sampling cycle. A value of 0 means that the adaptation factor will jump to the minimum value (p5428[0]) if the current limit is reached. The function is deactivated for a value of 100%.

For index [2]:

If the voltage across the line reactor exceeds the minimum value (p5428[0]) for at least 2 current controller sampling times, the adaptation factor will be weighted with this factor (p5428[2]) in every sampling cycle.

For index [3]:

If none of the above criteria for reducing the adaptation factor is met, the adaptation factor is increased by the percentage value p5428[3] in each current controller sampling time (the increase is additive). If the adaptation factor reaches the maximum value of 100%, the effect of precontrol by means of multiplication by the droop setpoint r5420 is cancelled out.

Description: Sets the proportional gain for the PI controller to suppress the direct component in the converter current.

Dependency: See also: p5437

Note: Recommended setting: p5436 = total resistance of reactor and transformer.

The parameter is preset when selecting the power unit (p201). In so doing, as approximation, a transformer with the same rating and a total power loss of 1.5 % is assumed:

p5436 = 1.5 % * r0206[0] / (3 * r0207[0] * r0207[0])

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0.0 [%]	1000.0 [%]	0.0 [%]

Description: Sets the gain for the DT1 element of the frequency droop.

In addition or alternatively to fast droop (p5413, p5414), with this D component power oscillations in the island line can be dampened.

The reference quantity is the gain of the regular frequency droop (p5407).

Recommendation: Typical setting values lie between 50 % and 100 %.

Dependency: See also: p5477

Note: With p5476 = 100 %, a frequency change from the power-frequency droop, unscaled for the integration of the line angle becomes effective.

With p5476 = 0, damping of the line control via the DT1 element is deactivated.

Min:	Max:	Factory setting:
5.0 [%]	2000.0 [%]	200.0 [%]

Description: Sets the smoothing time for the DT1 element of the frequency droop.
The reference quantity is the smoothing time for the regular frequency droop (p5409).

Recommendation: Typical setting values lie between 100 % and 200 %.

Dependency: See also: p5476

Note: With a lower smoothing time, the corner frequency of the high pass filter formed by the DT1 element increases. To dampen resonance in the line, the corner frequency must lie below the resonant frequency, and the setting value for the smoothing time must be selected to be correspondingly high.

p5480 Transformer magnetization mode / Tr mag mode

Description: Sets the mode for the transformer magnetization.

Using this function, a transformer is magnetized using a voltage that is in synchronism with the external line supply; this means that no inrush currents flow when this transformer is connected to the line supply.

If value = 11:

Automatic determination of the magnetizing inductance.

The magnetizing inductance determined in r5491 must be transferred to p5492 in order to take effect.

Observe notes regarding r5491.

If value = 12:

Automatic determination of the transformer phase shift and the gain correction.

The transformer phase shift determined in r6440 must be transferred to p6420 in order to take effect.

The gain correction determined in r6441 must be transferred to p6421 in order to take effect.

If value = 13:

Determination of the total leakage inductance of the transformer during line data identification. p3410 = 1 is set automatically and the inductance is measured on the next switch-on. Once the measurement has been completed the converter shuts down automatically and p3410 is set = 0 and p5480 is set = 1.

The total leakage inductance of the transformer determined in r5489 must be transferred to p5490 in order to take effect.

If value = 101:

The infeed goes into line droop control, however the main switch/circuit breaker is not closed, and the transformer magnetization remains in the state r5482 = 4.

Test operation requires the "Line droop control" function module to be activated (r0108.12 = 1).

If value = 102:

As for test operation 1.

However, synchronization with the line is not realized (VSM2 measured data r5460 and following is not used); instead, the output voltage is generated corresponding to the rated data p0210, p0211, p5486.

Value:

0: Deactivated
1: Normal operation
11: Identification transformer magnetizing inductance
12: Identification transformer phase shift/gain correction
13: Identification total transformer leakage inductance
101: Test operation 1 (without activation of circuit breaker)
102: Test oper. 2 (w/o activation of circuit breaker, without VSM2)

Dependency: See also: r5482, p5486, r5493, p5494, r5499, p5580

Notice: The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

For an active black start (p5580 > 0), a separate transformer magnetization is not performed.

Note: The transformer magnetizing function is used in order to magnetize a line transformer to which the Active Line Module (ALM) is connected.

The precondition is that the transformer can be isolated from the line supply on the primary side using a circuit breaker and that the DC link of the ALM is supplied from a separate power source before the circuit breaker is closed (e.g. with a separate precharging transformer or for photovoltaic applications).

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1

The status of the transformer magnetization, black start and island grid synchronization is displayed in r5499.

The status of the sequence control for transformer magnetization, black start and island grid synchronization is displayed in r5482.

If value = 13:

For weak line supplies, it is recommended to reduce the excitation current p3415 for identifying the inductance (e.g. p3415[0] = p3415[1] = 5 %).

Note: For index [0]:

Sets the ramp duration for the transformer voltage.

For index [1]:

Sets the bounce time for the circuit breaker at the line side of the line transformer.

An interruption-free connection between the line supply and the transformer is only guaranteed after the bounce time has expired.

The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

The wait state until the debounce time has expired is canceled if the following conditions are fulfilled:

- feedback signal p0860 = 1.
- current rise or DC link voltage change identified.

For index [2]:

Sets the permissible maximum time.

If the maximum time elapses without the line being synchronized, alarm A06502 is output.

The minimum duration of line synchronization is 25 % of this maximum time, however, as a minimum 40 ms.

Note: For index [0]:

Setting the rated primary voltage of the line transformer, at whose secondary the AIM and the ALM are connected.

If there is a circuit breaker at the transformer primary side, then the transformer can be magnetized before closing this circuit breaker in order to avoid high inrush currents.

The setting of this primary voltage and setting the device supply voltage (p0210) defines the transformer ratio.

To magnetize the transformer, the voltage has to be measured at the line side of the circuit breaker. To do this, an additional VSM must be connected and parameterized using p0150[0] and following. The voltage actual values of this VSM are displayed in r5461[0] and r5462[0]. The voltages converted over to the transformer secondary side are displayed in r5488[0, 1, 2].

For index [1]:

Setting the rated primary voltage of the line transformer; an island grid with ALM in the grid droop mode (p5401) is connected to the secondary of this transformer. Typically, the transformer primary is connected to the grid or to another island grid through a circuit breaker.

The setting of this primary voltage and setting the device supply voltage (p0210) defines the island grid transformer ratio.

To synchronize the island grid voltage with the external grid, the external grid voltage must be measured. To do this, an additional VSM must be connected and parameterized using p0150[1] and following. The voltage actual values of this VSM are displayed in r5461[1] and r5462[1]. The voltages converted over to the ALM connection point can be displayed in r5488[3, 4, 5]. To do this, the following BICO interconnections are acquired: p5487[2] = r5461[1], p5487[3] = r5462[1].

Notice: To transform the measured primary voltages to the transformer secondary side (ALM connection point), in addition to specifying the ratio (p0210, p5487), the phase angle (p6420) of the transformer must also be parameterized.

Before commissioning it is absolutely necessary that this phase angle is roughly set!

Using the transformer test mode (p5480 = 12), for the supply transformer, this angle and a gain error can be finely set.

Note: The rated voltage for the transformer primary side is set using p5486.

Dependency: See also: p5480, p5492

Notice: Overmodulation (r0074 > 97 %) during the measurement as a result of an excessively low DC link voltage, can have a significant influence on the measurement result. A countermeasure, for example, can be to reduce the output voltage using p5494.
The measurement result depends very strongly on precisely specifying the filter capacitance (p0221).
When filter monitoring is active (p3678 > 0), the current measured values of the VSM (r3671, r3672) are used to identify the magnetizing inductance. Incorrect VSM measured values result in excessively high deviations when determining the magnetizing inductance.

00	External precharging bypass contactor	Yes	No	-
01	Island grid circuit breaker	Yes	No	-

Dependency: See also: r0863, r3402

Caution: For bit 01:
Without any additional control logic, the signal is not suitable to control the island grid circuit breaker.
The signal only represents an enable signal to close the circuit breaker during the actual synchronization (r5499.5 = 1). For r5499.5 = 0, generally the following applies r5493.1 = 0.

Note: For bit 00:
The signal is used to control the external bridging contactor in the precharging circuit.
The external bridging contactor is closed if precharging is complete (r3402 > 5) and the circuit breaker has not been activated (r0863.1 = 0).
For bit 01:
The signal is used to control the circuit breaker between the island grid and the external grid.
The signal is set to 1, if the island grid was successfully synchronized. In this case, the conditions for synchronization (frequency, amplitude, phase angle, p5586) are maintained.

If the precharging circuit of an application only creates a low DC link voltage, which is not sufficient to fully magnetize the transformer (modulation depth r0074 limited), then the target value for the magnetization can be reduced (p5494[0]).
When closing the line contactor, the residual magnetization required only causes a relatively low recharging current surge that is generally within permissible limits.

Note:
VSM: Voltage Sensing Module

For bit 00:

When the bit is set, voltages (r5488[0, 1]) from the transformer model are used as input variable for the grid PLL (r3452 and following), which otherwise operates with the measured values of VSM1 (r3661, r3662).

This means, for example if the transformer properties are not known, a higher accuracy of the PLL can be achieved, and in turn the controller stability improved.

For booksize drive units, the following applies:

Before and during PLL synchronization (r3402 <= 7), p5495.0 is only effective if operation with VSM is activated (p3400.5 = 1).

10	Permit active power during non-symmetrical FRT	Yes	No	-

Dependency: See also: p5507, r5510, p5520

Note:

For bit 00:

If p5500.0 = 0 the output value of the grid support characteristic is added to the control's reactive current setpoint.

r0075 = p3610 + p3611 + r3471 + r5510[0]

For p5500.0 = 1, the dynamic reactive current setpoint p3611 is subtracted if dynamic grid support is active (r5502.1 = 1).

In this case, the following applies:

r0075 = p3610 + r3471 + r5510[0]

For bit 01:

Only active for p5500.3 = 0.

If p5500.1 = 0 the alpha and beta amplitudes of the line voltage, which were smoothed with p5507[2], are determined. The absolute value of the line voltage, calculated from these amplitudes, is used as input value for the characteristic for grid support. In the event of an asymmetrical line disturbance, oscillation of the reactive current setpoint (r5510) is prevented.

If p5500.1 = 1, the smoothed absolute value of the measured line voltage is used as the input value for the grid support characteristic. Smoothing is set with p5507[3].

For bit 02:

Only effective if p5500.1 = 0 and p5500.3 = 0.

If p5500.2 = 0, the maximum value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. The reactive current setpoint (r5510) will, therefore, remain virtually constant even in the event of asymmetrical line disturbance. Power fluctuations in the DC link are reduced.

If p5500.2 = 1, the average value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic.

For bit 03:

For p5500.3 = 0, no negative phase-sequence system current setpoint according to the characteristic is calculated. This means that the setpoints for the negative phase-sequence system current controller are also equal to 0 if the line supply is not symmetrical.

For p5500.3 = 1, for an asymmetrical line voltage, a negative phase-sequence system current setpoint is calculated, which counteracts the voltage asymmetry and therefore supports the grid.

The negative phase-sequence system current is impressed using the negative phase-sequence system controller (p3636 and following).

The negative phase-sequence system controller is automatically activated and deactivated (the following applies, p3640.0 = p5500.3).

For bit 04:

Only active for p5500.3 = 1.

For p5500.4 = 0, a negative phase-sequence system current setpoint according to characteristic p5505/p5506 is generated if the difference between two line phase voltage amplitudes is greater than p5509[9] - and the amplitude of at least one line phase voltage exceeds the line tolerance range according to the characteristic.

For p5500.4 = 1, an already supporting negative phase-sequence system current is impressed according to the characteristic, if only the difference between two line phase voltage amplitudes is greater than p5509[9].

For bit 05:

For p5500.5 = 1, the limiting of the support reactive current is not active according to the characteristic p5505/p5506. Instead, the current limits p5506[1] and p5506[3] are effective after adding the supplementary reactive current setpoints p3610 and p3611.

For bit 06:

For p5500.6 = 1, the apparent current is limited to the smoothed apparent current (r0027) effective at the start of an FRT. During this line fault, this value of the apparent current limit is continually effective.

For bit 07:

Only effective for p5526.7 = 1 and p192.19 = 1

For p5500.7 = 1, for each phase, a tolerance band is generated around the current setpoint, which the current actual value does not leave.

For p5500.7 = 0, a tolerance band is generated based on the current setpoint amplitude. The current actual value for each phase can be within this tolerance band.

For bit 08:

Only active for p5500.3 = 1.

For p5500.8 = 1, during a line short-circuit (r5502.4 = 1) the active line infeed current is reduced to zero.

For p5500.8 = 0, during a line short circuit (r5502.4 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For bit 09:

Only active for p5500.3 = 1.

For p5500.9 = 1, during a line short-circuit (r5502.4 = 1) the active line infeed current and the supporting reactive current are reduced to zero.

For p5500.9 = 0, the standard response of dynamic line support applies corresponding to p5500.8 = 0.

For bit 10:

Only active for p5500.3 = 1.

For p5500.10 = 1, during an asymmetrical line short circuit (r5502.2 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For p5500.10 = 0, during an asymmetrical line short-circuit (r5502.2 = 1) the active line infeed current is reduced to zero.

Description: Sets the signal source to activate dynamic grid support.

BI: p5501 = 1 signal:

Activates dynamic grid support.

BI: p5501 = 0 signal:

Deactivates dynamic grid support.

Recommendation: The smoothing time for the line PLL (p3458[1]) should be set to values higher than 20 ms so as to ensure stable operation even with significant dips in supply voltage.

Dependency: For p5501[0], the following applies:

The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source.

Notice: Dynamic grid support can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

Note: If grid support has been activated:

Line disturbance will trigger grid support in accordance with the set characteristic (p5505, p5506).

If grid support is deactivated:

Line disturbance will generate the standard response to phase failures on the part of the infeed for drive applications (see A06205).

The reactive current setpoint is limited according to the set characteristic.
For p5500.5 = 0, the following applies:
In the event of voltage deviations above the finishing points of the positive or the negative characteristic (p5505[1], p5505[3]), grid support is limited to the reactive current setpoint of the corresponding finishing point (p5506[1], p5506[3]).

Description: Sets the time values for dynamic grid support.

Recommendation: For index [0]:

For the run-on time p5507[0], the current limits parameterized for the dynamic grid support remain valid (e.g. p5509[11]). If a grid standard specifies that the active power is re-established faster, then we recommend that the run-on time is reduced (e.g. p5507[0] = 20 ms).

Index:
[0] = Minimum time dynamic grid support
[1] = Minimum time line disturbance
[2] = Smoothing time alpha/beta
[3] = Smoothing time instantaneous value
[4] = Minimum time non-symmetrical grid fault

Dependency: See also: p5500, p5509, p5529

Note: For index [0]:

Minimum time for continuing grid support in accordance with the characteristic once the line voltage has returned to the permissible tolerance range between the two starting points (p5505[0], p5505[2]).

For index [1]:

Minimum time for line disturbance for the start of grid support in accordance with the characteristic.

If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

For index [2]:

Smoothing time for the calculation of the alpha amplitude and the beta amplitude of the line voltage if p5500.1 = 0.

An estimated value for the actual line voltage absolute value is calculated from the alpha and beta amplitudes and serves as the input value for the grid support characteristic.

A smoothing time of less than a line period makes no sense.

If the estimated absolute value deviates from the smoothed measured voltage absolute value by more than 25%, the smoothed measured value is used. This corresponds to a temporary automatic changeover from p5500.1 = 0 to p5500.1 = 1.

For index [3]:

Smoothing time for the measured absolute value of the line voltage if p5500.1 = 1.

The smoothed absolute value of the line voltage is used as the input value for the grid support characteristic.

Setting p5507[3] = 0 deactivates smoothing.

For index [4]:

Minimum time for a non-symmetrical line disturbance for the start of grid support in accordance with the characteristic p5506 and scaling factor p5509[12].

If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

Description: Sets the scaling values for dynamic grid support.

Recommendation: For index [0]:

If the reactive current setpoint increases to rapidly, at the start of a grid fault, this can result in DC link overvoltages. If possible, we then recommend p5509[0] = 5 ... 10 %.

For index [1]:

In order to guarantee that the support reactive current is kept, even when the Vdc thresholds p5508 are reached, we recommend p5509[1] = 0.1 %.

For index [7]:

If a support reactive current is also required for a non-symmetrical grid faults, then correspondingly p5509[7] must be set > 0.1 % (typically = 100 %).

For index [8]:

If a support reactive current is also required for non-symmetrical grid faults, then we recommend p5509[8] > 20 % in order to reduce Vdc oscillation.

For index [11]:

A value p5509[11] > 30 % can help avoid DC link overvoltages during grid faults.

Index: [0] = Ramp reactive current at the beginning/end of grid support

[13] = Grid voltage change for fast precontrol adaptation
[14] = Reactive current limiting scaling

Dependency: See also: p5505, p5506, p5508

Notice: For index [5]:

For devices with r0192.19 = 0 (e.g., Active Line Module Booksize), the maximum apparent current limit can be set to p5509[5] = 80 %.

Note:

For index [0]:

Change in the reactive current setpoint (% per ms) at the beginning and end of dynamic grid support.

This avoids sudden changes in the reactive current if the starting points for the line voltage (p5505[0], p5505[2]) are overshot.

For index [1]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is overshot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

The reactive current ramp is deactivated with p5509[1] = 0.1 %. The reactive current required for dynamic support is also kept, even when the Vdc threshold is reached.

For index [2]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is undershot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

For index [3]:

Sets the hysteresis for the line voltage to exit grid support (as a percentage of the supply voltage p0210).

To exit grid support, the line voltage must be in the interval reduced by the hysteresis width (the interval is defined with the starting points p5505[0] and p5505[2] and the hysteresis width p5509[3]).

For index [4]:

Sets the scaling factor for the reference voltage for dynamic grid support (as a percentage of the supply voltage p0210).

As a result, the product of p0210 x p5509[4] is applied as the voltage zero.

For index [5]:

Sets the scaling factor for the maximum permissible absolute apparent current value when grid support is active (p5501 = 1 signal).

The value is referred to the maximum current r0209.

Values higher than 100% will not be applied.

Values greater than 80% can only be set if the duration that can be set is less than or equal to 3 seconds for the short-circuit state p5528.

For Active Line Module Booksize, the setting value is limited to 80 %.

For index [6]:

Only active for p5500.3 = 1.

Sets the percentage voltage change (as a percentage of p0210) from which value the calculated positive phase-sequence system and negative phase-sequence system amplitudes are quickly adapted. As a consequence, the grid is quickly supported when step-type faults occur.

For index [7]:

Only active for p5500.3 = 1.

Sets the maximum positive phase-sequence system reactive current absolute value to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

If a symmetrical support reactive current (positive phase-sequence system current), is also specified for non-symmetrical grid faults, then generally, p5509[7] should be set to = 100 %.

For index [8]:

Only active for p5500.3 = 1.

Sets the maximum negative phase-sequence system absolute current to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

For the case p5509[7] = 100 %, we recommend setting p5509[8] > 20 %.

For index [9]:

Only active for p5500.3 = 1.

Sets the minimum value of the voltage asymmetry to impress a negative phase-sequence system current for asymmetrical grid support.

For p5500.4 = 1, a negative phase-sequence system current is already impressed, if the voltage asymmetry exceeds the set value.

For p5500.4 = 0, in addition, for at least one of the phase voltages, the tolerance condition from the characteristic p5505 / p5506 must be exceeded.

For index [10]:

Only active for p5500.3 = 1.

Sets the maximum value of the voltage asymmetry to end asymmetrical grid support.

This means that parameters p5509[9] and p5509[10] define a hysteresis range.

For index [11]:

Only active for p5500.3 = 1.

Sets the scaling factor for the permissible negative active current value for grid voltage out of tolerance (r5502.1 = 1).

The value is referred to the permissible apparent current p5509[5] * r0209.

For index [12]:

Only active for p5500.3 = 1.

Sets the scaling factor for dynamic grid support for 2-phase grid dips. The gradient of the support characteristic p5505/p5506 is scaled using this factor if asymmetry (r5502.2=1) is present. The setting of p5509[0] is applicable for the transition ramp

For index [13]:

Only active for p5500.3 = 1.

If the grid voltage dips by this voltage with respect to the value of p0210, then the voltage precontrol is quickly adapted based on the calculated positive phase-sequence system and negative phase-sequence system amplitudes.

For index [14]:

Sets the scaling factor for the maximum permissible reactive current absolute value when grid support is active (p5501 = 1 signal).

The value is referred to the rated current r0207.

Values greater than 150% cannot be set.

Values greater than 105% can only be set if the following applies - r0193.16 = 1 and p5509[8] <= 100%.

For Active Line Module Booksize devices, the setting value is limited to 105 %.

Description: Sets the tolerance range for the second stage of the current limiting.
Only for internal Siemens use.

Index: [0] = Line parallel operation: No-load operation
[1] = Line parallel operation: Normal operation
[2] = Line parallel operation: Short-circuit operation

Dependency: See also: p5523

Note: The value refers to r0209.
If the current absolute value of a line phase exceeds the tolerance threshold (p5523 + p5525), then the pulses in all of the line phases are inhibited for one cycle.
If the current actual value increases in spite of this second current limiting stage, then the system fault trips (F30001).

Note:
For index [0]:
Minimum time for operating state "Rated operation" for change to "No-load operation".
For index [1]:
Permissible short-circuit duration.
If the short circuit is not cleared within this time, then the system shuts down with fault F06850.
Values greater than 3 s can only be set if the maximum device current when a short-circuit occurs p5509[5] is limited to 80 %.
For index [2]:
During a grid short-circuit, the grid PLL is inhibited for a maximum of this time in order to prevent loss of orientation to the grid.
For index [3]:
Sets a wait time for the decay of transient processes at the start of a short-circuit (r5502.4 = 1).
After this time expires, a function to quickly identify grid recovery is activated (p5529[7]).
For index [4]:
Sets the calibration time for the function to quickly identify line recovery.
During this time (after wait time p5529[3] expires), automatically all of the actual current and voltage thresholds for the detection function are determined (see p5529[4, 5]).

Min:	**Max:**	**Factory setting:**
-	-	0000 0110 0000 0011 bin

Description: Sets the configuration for line monitoring.
Line monitoring is activated using binector input p5541 = 1 signal.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	Voltage and frequency monitoring	Yes	No	-
01	AISL frequency shift technique	Yes	No	-
04	FRT voltage time characteristic	Yes	No	7999
05	FRT shutdown delayed	Yes	No	7999
07	FRT frequency-time characteristic	Yes	No	7999
09	Line synchronization voltage/frequency check	Yes	No	-
10	FRT time characteristic separate initiation	Yes	No	-

Dependency: See also: p5541
See also: F06851

Notice: For bit 00:
Fault F06851 is additionally displayed if, as a result of a line voltage fault, the current control was inhibited (alarm A06205, r03405.2 = 1) - and the inhibit is continuously active while the wait time is elapsing (p5545[0]). To make reference to the temporarily output alarm A06205, fault F06200 is subsequently output.

Note: AISL: Anti Islanding

FRT: Fault Ride Through (riding through a grid fault)

HFRT: High Frequency Ride Through (riding through frequency increases)

HVRT: High Voltage Ride Through (riding through voltage increases)

LFRT: Low Frequency Ride Through (riding through frequency dips)

LVRT: Low Voltage Ride Through (riding through voltage dips)

For bit 00:

The monitoring thresholds of the voltage and frequency criterion are defined using p5543 and p5544. If these thresholds are violated, then this is flagged in status word r5542 bits 6 to 9. If the violation remains during wait time p5545[0], then fault F06851 is output.

For bit 01:

The frequency shift technique actively changes the frequency that is fed in. For islanding formation this results in the permissible frequency bandwidth being violated. Shut down is realized via fault F06851.

For bit 04:

It is only possible to activate the FRT voltage-time characteristic (HVRT, LVRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5543 are deactivated. The voltage-time monitoring to be set using p5550 to p5554 applies (display in r5542 bits 10 and 11).

For bit 05:

Sets the response after a voltage dip (LVRT).

0 = immediate shutdown.

1 = shutdown only after the time in p5545[2] has expired.

For bit 07:

It is only possible to activate the FRT frequency-time characteristic (HFRT, LFRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5544 are deactivated. The frequency-time monitoring to be set using p5555 to p5559 applies (display in r5542 bits 12 and 13).

For bit 09:

The additional voltage and frequency check is activated when switching on. To do this, before operation is enabled, a check is made against the limits p5543[2, 3] and p5544[2, 3], and the system waits until these limits are maintained (r3402 = 7 or r3402 = 12 when transformer magnetization is active (p5480 > 0)).

If the voltage and frequency limits are violated, then this is indicated in status word r5542 bits 6 to 9.

For bit 10 (only effective for p5540.4 = 1 or p5540.7 = 1):

0 = when the overvoltage or undervoltage limit is violated (p5550[0, 1]), both curves (overvoltage and undervoltage curve) always start at the same time. Correspondingly applies for the frequency-time characteristics.

1 = activation of separate initiation of FRT voltage-time characteristics for an overvoltage or undervoltage event. Correspondingly applies for the frequency-time characteristics.

It is recommended that the PLL2 should be deactivated if invalid voltage values are present (e.g. when the power supply is shutdown).

After activation initially a PLL synchronization is carried out. An excessively low voltage prevents synchronization from starting and this is displayed using r5572.3...0 = 1011.

For bit 01:

After PLL synchronization starts (r5572.0 = 0) and the settling time has expired, the actual values are valid for phase angle, frequency and amplitude (r5572.1 = 0).

In operation, r5572.1 is set = 1 if the absolute value of the PLL angular error - smoothed over 50 ms - exceeds a value of 7.5 °. The PLL actual values are then no longer valid.

The tolerance limits are set using p0284 and p0285.

The following interconnection is practical for synchronizing an island grid to another grid (typically: public grid):

- the voltage of the island grid is measured using a VSM (r5461[0] and r5462[0]), which is connected in front of the circuit breaker between the island grid and the ALM.

- the voltage of the external grid is measured using another VSM (r5461[1] and r5462[1]), which is connected in front of the circuit breaker between the external grid and the island grid. The voltages (r5488[3, 4]) transformed to the ALM supply voltage are used as input variables for the PLL2.

Description: Sets the mode for the black start.

An island grid, which at the start has no voltage, can be established using this function. In this case, the ALM acts as the grid voltage source or as grid generator for the connected island grid.

Prerequisite:

Activating function module "Line droop control" (r0108.12 = 1) and line droop operation (p5401).

If value = 0:

The black start is deactivated.

If value = 2:

At the next switch on, a black start is carried out. Here, the precondition is that the line voltage is close to zero (less than p5586[0]). Using the grid droop control, the grid voltage is increased up to the rated value using a ramp function.

If value = 3:

At the next switch on, a black start is carried out if the grid voltage is less than p5586[0]. If on the other hand, a grid is connected within the regular tolerances (p0281, p0282), then a regular switching-on operation is carried out with synchronization to the existing grid voltage.

If, in so doing, transformer magnetization is activated (p5480 = 1), then this is performed.

Value:
0: Deactivated
2: Grid black start
3: Grid black start automatic

Notice:
A black start is only possible when the grid droop control (p5401) is activated.

A black start is only possible when the transformer test operation mode is deactivated (p5480 <= 1).

The use of feedback signal contacts from the circuit breaker between the Active Interface Module and the island grid is urgently recommended (p0860).

Note:
Precondition for establishing a voltage in an island grid is that adequate power is supplied into the ALM DC link (e.g. generator, photovoltaic) as well as control of the DC link voltage using this power generation system. The power requirement of the Island grid must not exceed the power of the generating system - even briefly.

In order to avoid the high inrush currents,when the grid is being established, the voltage is ramped up to the rated value. At the end of the voltage ramp, the system changes over into regular grid droop operation. The ALM then operates as grid-generating voltage source using active and reactive power droop, also with other sources of power in the island grid, in a stable fashion. The other power units can then act as a current source to support the grid or as a voltage source to form a grid. As grid forming unit, then the other power units must also have a grid droop function.

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1 Before closing this switch, it is checked as to whether the island grid is in a non-voltage condition. A possibly existing residual voltage in the Active Interface Module is automatically controlled down to zero.

Description: Display and connector output of the supplementary setpoints for the frequency and voltage control during island grid synchronization.

Index: [0] = Setpoint ramp frequency
[1] = Setpoint ramp voltage

Notice: In order to avoid equalization operations, after island synchronization has been completed, it is not permissible that supplementary setpoints for frequency and voltage are suddenly set to zero (as step function). This is the reason that after ending synchronization, the setpoints are held constant and reset with the trigger signal p5583[2] = 1.
In the same controller cycle, the signals for smoothed frequency (p5406[0]) and voltage (p5416[0]) are corrected by the corresponding absolute values!
The supplementary setpoints (r5582) are automatically reset when synchronization is canceled and when the grid droop (p5401) is deactivated with a change into regular closed-loop current control operation (with adaptation to the grid frequency).

Note: In the default setting, the setpoints are connected with the unfiltered setpoint inputs (no-load frequency p5406[1], no-load voltage p5416[1]) of the grid droop. While synchronizing the island grid to an external grid, the amplitude, phase angle as well as the frequency of the island grid are adapted in this fashion.
The setpoints for synchronizing can also be used for synchronous voltage and frequency adaptation of additional power generating systems in the island grid.

Description: Sets the signal sources for island grid synchronization.

Using the island grid synchronization function, an island grid can be synchronized with an external grid regarding frequency, phase angle and voltage amplitude.

After synchronization has been performed, a circuit breaker between the two grids can be closed (r5493.1).

Index: [0] = Start
[1] = Circuit breaker feedback signal
[2] = Reset setpoints

Notice: For index [1]:

The feedback signal contact of the circuit breaker between the external grid and the island grid (in front of the grid transformer) must be connected in parallel via binector input p5583[1].

The feedback signal is required for a state change in the synchronization sequence control. This signal is not used to completely monitor the contactor (p0860 and following).

Note: In order to synchronize an island grid with an external grid, frequency, phase position and amplitude of the island grid must be changed in operation!

This assumes that the components of the island grid are suitable for these parameter changes and that the ALM is the only grid generator in the island grid.

For index [0]:

Signal source for the start command to synchronize the island grid with an external grid.

The target values for the synchronization, are the output values of the PLL2 (r6311[1], r6313, r6314).

The PLL2 must be activated at the latest when synchronization starts (p5571, p5574).

At the same time as the reset command, the external cyclic supplementary setpoints (p5406[0], p5416[0]) must be appropriately adapted.

Description: Sets the time values to control an asymmetrical voltage output.

Index: [0] = Asymmetry duration
[1] = Duration of the start ramp
[2] = Duration of the end ramp

Dependency: See also: p5589, p5590, p5591

Notice: The set time values cannot be precisely implemented, but only rounded off to interval limits corresponding to the current controller sampling time (p0115[0]).

Note: For index [0]:

Sets the duration of the asymmetrical voltage output. After reaching the set duration, the asymmetry is exited and the regular symmetrical grid voltage droop becomes active again. To start an additional voltage asymmetry, a 0/1 edge of the activation signal p5591 is first required.

With p5588[0] = 0, the asymmetry set with p5590 is active without any time limit (up until it is deactivated with p5591 = 0).

For index [1]:

Sets the duration of an initial ramp at the start of the asymmetrical voltage output.

When required, with a ramp, overvoltages in systems that are capable of oscillation can be prevented.

The ramp starts as soon as the trigger condition according to p5589 is fulfilled.

During the ramp, the voltage output is changed step-by-step from the regular symmetrical rotating voltage vector into the asymmetry set using p5590.

The ramp is part of the duration of the asymmetrical voltage output set using p5588[0].

With p5588[1] = 0, the ramp is deactivated and the voltage is immediately changed (step function) to the set asymmetry (p5590).

For index [2]:

Sets the duration of an end ramp at the completion of the asymmetrical voltage output.

When required, with a ramp, overvoltages in systems that are capable of oscillation can be prevented.

The ramp starts as soon as the time for the asymmetrical voltage output has expired. As a consequence, the end ramp is not part of the duration set using p5588[0].

During the ramp, the voltage output is changed step-by-step from the asymmetry set using p5590 to the regular symmetrical rotating voltage vector.

With p5588[2] = 0, the ramp is deactivated and the voltage is immediately changed (step function) to the set asymmetry (p5590).

-1.0 [°]	360.0 [°]	-1.0 [°]

Description: Sets the trigger angle for the asymmetrical voltage output.

Dependency: See also: p5590, p5591

Notice: The set angular values cannot be precisely implemented, but only rounded off to interval limits corresponding to the current controller sampling time (p0115[0]).

Example:

With p0115[0] = 0.25 ms and a 50 Hz line frequency, an angular resolution of 0.25 ms * 50 Hz * 360 ° = 4.5 ° is obtained.

Note: The function is activated using binector input p5591 = 0/1 signal.

After this function is activated, the start of asymmetry is delayed until the phase angle (r5412) reaches the value of p5589. This means that asymmetrical voltage changes can be implemented, which can be synchronized with the basic fundamental of the grid voltage - and that are reproducible.

With p5589 < 0 °, asymmetry starts immediately with the 0/1 edge, and is therefore not synchronized with the grid voltage.

[8] 5594[8]

Description:
Sets the signal sources for scaling the individual phase and line voltages.
This therefore allows asymmetrical voltage sources to be implemented (negative phase-sequence system voltage not equal to 0).
The scaling of phase and line voltages can be freely combined.
As a result of the 3-conductor connection, using the power unit, a zero system cannot be implemented as a result of the inherent operating principle. As a consequence, the sum of the output voltages is always 0.
We recommend that p5594 is used for simple handling based on fixed values.

[1] = Differential voltage factor ST
[2] = Differential voltage factor TR
[3] = Phase voltage factor R
[4] = Phase voltage factor S
[5] = Phase voltage factor T
[6] = Zero system voltage factor R0
[7] = Zero system voltage factor S0
[8] = Zero system voltage factor T0

Dependency:
See also: p5415, p5416, p5594

Danger:

By scaling the phase voltages, phase short-circuits as well as overcontrol of the phase voltages (with overvoltages and high harmonic components) can be realized.
This means that special care must be taken when using this function.
The complete system with all of the connected components must be designed for the resulting current and voltage levels in order to rule out injury and material damage.

Notice:
The voltage control of the grid droop (p5429) uses the symmetrical basic fundamental amplitude (positive phase-sequence system voltage) as control variable. Changing an individual phase voltage therefore results in an undesirable subsequent control of the positive phase sequences system voltage.
In the case of an asymmetrical setpoint voltage due to p5590, we therefore recommend that p5426 = p5427 are set = 0.
For the same reason, generally the modulation depth controller (r5433) must be deactivated.
The setting value of indices 6, 7 and 8 together must add up to 300% in order to ensure that the zero system is completely subdivided. Otherwise, a remaining zero system is automatically distributed internally and symmetrically across all 3 phases.

Note:

Using the grid droop function (p5415, p5416), depending on the reactive current actual value, a voltage amplitude is calculated for all 3 grid phases (positive phase-sequence system voltage, r5429). The amplitude of the individual grid phases is obtained by multiplying this positive phase-sequence system voltage by the associated scaling factors p5590[...]. The DC component control (p5436), the harmonic control (p5440) and the interventions when reaching the current limits (p5478) remain active, also for asymmetrical setpoint voltages.

The setting p5590[...] = 1 deactivates the corresponding scaling (as a consequence, internally a value of 100% is active).

For index [0, 1, 2]:

Virtual three-phase voltage source in a delta connection.

Internally, the values are limited to the range 0 ... 100%.

Setpoint voltage amplitude phase RS: U_RS = r5429 * root(2) * p5590[0]

Setpoint voltage amplitude phase ST: U_ST = r5429 * root(2) * p5590[1]

Setpoint voltage amplitude phase TR: U_TR = r5429 * root(2) * p5590[2]

The instantaneous voltages are internally adapted using a transformation matrix so that a zero system-free three-phase voltage system is obtained. For example, a short circuit between phases R and S can be directly emulated using p5590[0].

For index [3, 4, 5]:

Virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range 0 ... 150%.

Setpoint voltage amplitude phase R: U_R = r5429 * root(2/3) * p5590[3]

Setpoint voltage amplitude phase S: U_S = r5429 * root(2/3) * p5590[4]

Setpoint voltage amplitude phase T: U_T = r5429 * root(2/3) * p5590[5]

As the sum of the 3 sinusoidal voltages must be 0 at any particular instant in time, the average value of the instantaneous voltages are subtracted in each phase (i.e. the zero system components are evenly distributed across the 3 branches). For example, this is the reason that p5590[3] = 0% does not result in a DC voltage of 0 in phase R.

For index [6, 7, 8]:

Zero system distribution of the virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range -300 ... 300 %.

Using these factors, it is defined with which component an existing zero system (instantaneous value u0 = (u_R + u_S + u_T)/3) should be subtracted in the individual phases.

Zero system correction phase R: u1_R = u_R - u0 * p5590[6]

Zero system correction phase S: u1_S = u_S - u0 * p5590[7]

Zero system correction phase T: u1_T = u_T - u0 * p5590[8]

In order to obtain a zero system-free U1 system, p5590[6] + p5590[7] + p5590[8] must = 300%. If this condition is violated, then the remaining zero system component is evenly distributed across all 3 branches.

Example:

The combination of p5590[3] = 0% and p5590[6] = 0% results in a voltage 0 in phase R. The phase voltage U_ST keeps its rated value, the sinusoidal curves of the two other differential voltages lie one above the other.

Warning: Switching-in with a significantly incorrectly parameterized offset angle (> 5 °) can cause a peak current intervention and / or triggering the crowbar thyristor.

Caution: If this parameter is changed in the "ready for operation" state and if a synchronizing voltage is already available at the VSM, under certain circumstances, a line supply fault can be signaled. When this occurs for the first time after changing the parameter, the fault can be ignored and acknowledged.

Note: This phase shift must be determined when commissioning the system.
Example:
If the converter input voltage (= secondary side voltage of the power transformer) lags the synchronizing voltage measured by the VSM by 30 °, then p6420 should be set to -30°.

Description: Setting to reverse the rotating field direction of the synchronizing voltage system measured by the Voltage Sensing Module (VSM).

Value:
0: Rotating field direction positive
1: Rotating field negative

Warning: Only use in an emergency if it is not possible to correct the wiring. Extreme caution must be applied in this case when measuring the phase shift (p6420).

Note: Allows the rotating field direction to be adapted if there is inconsistency in the wiring.

Description: Displays the phase shift between the primary and secondary voltages of the line transformer identified by automatic transformer identification (p5480 = 12).

Dependency: See also: p5480, p6420

Note: The phase shift relates to the primary side of the transformer, which is connected to the line. The secondary side is connected to the infeed.
The display value is reset to 0 at POWER ON.
Example:
A Dy5n transformer has a phase shift of -5 x 30 ° = -150 °.
This means that the secondary voltage is shifted from the primary voltage by -150 °, the primary voltage leads by 150 °.
The result should be entered into p6420. During identification, the value previously entered in p6420 is not effective.

Description: Setting to parameterize the recorder.

The recorder supplies up to 64 internal variables (depending on the parameterization). The maximum recording time is 2000 ms. The variables are acquired in the current controller sampling time – and a pretrigger can be set. The values can then be acyclically written to the memory card.

The development and system test departments have the software necessary to decode the content.

Index:
[0] = Enable
[1] = Recording time
[2] = Pre-trigger time
[3] = Output message
[4] = Recording factor

Dependency: See also: A49998

Note:

For index [0]:
Enables or disables the function.
p6999[0] = 0
Inhibits the function.
p6999[0] = 1
Enables the function.
For index [1]:
Sets the recording time, [ms].
A maximum of 8000 measuring points can be recorded across all drive objects. 1 measuring point is created in one current controller sampling time.
Example:
The "Recorder" function module is activated on 4 drive objects. The current controller sampling time (p0115[0]) is 250 µs.
--> every drive object can record a maximum of 8000/4 = 2000 measuring points.
--> the recording time that can be realized is 2000 * 0.250 ms = 500 ms.
Note:
- the recording time that can be realized is displayed in r6991[1].
- if the recording time is set too long, then it is automatically reduced to what can be realized.
For index [2]:
Sets the pretrigger time, [ms].
This time is included in the recording time and cannot be longer than the recording time p6999[1].
Note:
- when the recording time is automatically reduced, the pretrigger time is correspondingly reduced as well.
- the pretrigger time that can be realized is displayed in r6991[2].
For index [3]:
Enables or disables the output of message A49998 when the trigger event is triggered.
For index [4]:
p6999[4] = n, n = 0 ... 4
Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2] 2^n times, and reduces the number of signals 2^n times.
Example:
Number of drive objects = 1, p0115[0] = 250 µs, p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4
--> recording time: 2000 ms * 2^4 = 32 s, pre-trigger time:1000 ms * 2^4 = 16 s, number of signals 64/16 = 4.
When setting p6999[4] to 0, the results are as follows:
--> recording time: 2000 ms, pre-trigger time: 1000 ms, number of signals: 64

1: Activated

Dependency: See also: r7000

Caution:

For a parallel connection, the following applies:
When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.

Note: For motors with separate winding systems (p7003 = 1) it is not possible to inhibit an individual power unit.
p7001 is automatically reset if a power unit is deactivated via p0125 or p0895.

Description: Specifies the motor winding system when power units are connected in parallel.

Value:
0: One-winding system
1: Several separate winding systems or motors
2: Two separate offset winding systems

Dependency: For p7003 = 2:
In order to permit separate, offset winding systems, wobbulation must first be deactivated (p1810.2 = 0). The magnitude and direction of the offset is parameterized in p6397.
When exiting commissioning, the circulating current control is automatically deactivated (p7035 = 0), and the compensation of the valve interlocking times is replaced by the appropriate stator resistance adaptation (p1780.7 = 1).
See also: p1802, p6397

Notice: If, for motors with multi-winding system, the individual winding is connected with several partial inverters, then a development system (p7003 = 0) must be parameterized. The cable resistance should be entered in p0352 - and then the motor data identification performed with configuration p1909.20 = 1 (estimate cable resistance).

Note: For p7003 = 0:
- the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352.
- the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1).
- individual Motor Modules can be activated and deactivated (p7001).

For p7003 = 1, 2:
- the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352).
- all Motor Modules are activated. It is not possible to deactivate a Motor Module.

Description: Displays the status of power cycling counter for valve 1.
For repairs, this parameter serves as internal documentation for service personnel.
The counter state corresponds to the valve wear.

Dependency: See also: p7786

Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.

Note: The IGBT power cycling counter can only be set to 0.
Procedure when replacing valve 1:
1. Switch off the system and replace valve 1.
2. Switch on the system and acknowledge that valve 1 has been replaced (p7786.1 = 1).
--> the power cycling counter of valve 1 is then reset (r7740 = 0).
3. Carry out a POWER ON (switch-off/switch-on).
--> as a consequence p7786.1 is automatically set to 0.

Description: Displays the status of power cycling counter for valve 2.
For repairs, this parameter serves as internal documentation for service personnel.
The counter state corresponds to the valve wear.

Dependency: See also: p7786

Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.

Note: The IGBT power cycling counter can only be set to 0.
Procedure when replacing valve 2:
1. Switch off the system and replace valve 2.
2. Switch on the system and acknowledge that valve 2 has been replaced (p7786.2 = 1).
--> the power cycling counter of valve 2 is reset (r7741 = 0).
3. Carry out a POWER ON (switch-off/switch-on).

The counter state corresponds to the valve wear.

Dependency: See also: p7786

Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.

Note: The IGBT power cycling counter can only be set to 0.
Procedure when replacing valve 3:
1. Switch off the system and replace valve 3.
2. Switch on the system and acknowledge that valve 3 has been replaced (p7786.3 = 1).
--> the power cycling counter of valve 3 is reset (r7742 = 0).
3. Carry out a POWER ON (switch-off/switch-on).

For repairs, this parameter serves as internal documentation for service personnel.
The counter state corresponds to the valve wear.

Dependency: See also: p7786

Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.

Note: The IGBT power cycling counter can only be set to 0.
Procedure when replacing valve 4:
1. Switch off the system and replace valve 4.
2. Switch on the system and acknowledge that valve 4 has been replaced (p7786.4 = 1).

The counter state corresponds to the valve wear.

Dependency: See also: p7786

Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.

Note: The IGBT power cycling counter can only be set to 0.
Procedure when replacing valve 5:
1. Switch off the system and replace valve 5.
2. Switch on the system and acknowledge that valve 5 has been replaced (p7786.5 = 1).

The counter state corresponds to the valve wear.
Dependency: See also: p7786
Notice: After a valve has been replaced, the corresponding power cycling counter must be reset.
Note: The IGBT power cycling counter can only be set to 0.
Procedure when replacing valve 6:
1. Switch off the system and replace valve 6.
2. Switch on the system and acknowledge that valve 6 has been replaced (p7786.6 = 1).
--> the power cycling counter of valve 6 is reset (r7745 = 0).
3. Carry out a POWER ON (switch-off/switch-on).

Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.

Dependency: See also: p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".

- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

12	Reserved, Siemens-internal	Yes	No	-

Dependency: See also: p7761, p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

For bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

Description: Configuration settings for know-how protection.

For bit 00, 01:

When KHP is activated, this means that the OEM can define whether the parameters and DCC data encrypted on the memory card should be protected before using on other memory cards/Control Units.

For bit 02:

This means that the OEM can define whether it is possible or not to trace the drive data using the device trace function although KHP is activated.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	Extended copy protection - linked to the memory card and CU	Yes	No	-
01	Basic copy protection - linked to the memory card	Yes	No	-
02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

Dependency: See also: p7766, p7767, p7768

Note: KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

[0] = character 1 (e.g. 49 dec)

[1] = character 2 (e.g. 50 dec)

...

[5] = character 6 (e.g. 99 dec)

[29] = 0 dec (completes the entry)

Dependency: See also: p7767, p7768

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

When using the STARTER commissioning tool, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- password entry must start with p7766[0].
- no gaps are permissible in the password.
- entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

Note: KHP: Know-How Protection
When reading, p7766[0...29] = 42 dec (ASCII character = "*") is displayed.
Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection.
Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated.
A product-specific list of these parameters is also available in the corresponding List Manual.

Description: Sets the reference serial number for the memory card.
Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.
Dependency: See also: p7765, p7766, p7767, p7768
Note: KHP: Know-How Protection
- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

Description: Sets the action to be executed for NVRAM data.

At the end of the action the value is automatically set to 0.

Value:
0: Inactive
1: Load NVRAM data to parameters
2: Load parameters to NVRAM
3: Reset

Notice: After action p7770 = 1 no more pulses may be enabled.

After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.

Note: If value = 1:

This action loads the NVRAM data to the parameters.

If value = 2:

This action loads the parameters to the NVRAM.

If value = 3:

This action sets parameters p7771 ... p7774 to the factory setting.

It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

p7775 NVRAM data backup/import/delete / NVRAM backup

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410

Description: Setting to backup/import/delete NVRAM data.

NVRAM data are non-volatile data in the device (e.g. fault buffer).

For NVRAM data actions, the following data are excluded:

- crash diagnostics
- CU operating hours counter
- CU temperature
- safety logbook

Value:
0: Inactive
1: NVRAM data backup to memory card
2: Import NVRAM data from the memory card
3: Delete NVRAM data in the device
10: Error when clearing
11: Error when backing up, memory card not available
12: Error when backing up, insufficient memory space
13: Error when backing up
14: Error when importing, memory card not available
15: Error when importing, checksum error
16: Error when importing, no NVRAM data available
17: Error when importing

Notice: For value = 2, 3:
These actions are only possible when pulses are inhibited.

Note: After the action has been successfully completed, the parameter is automatically set to zero.
The actions importing and deleting NVRAM data immediately initiate a warm restart.
If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

Description: Service parameter to internally document repairs.
After a component has been replaced, this must be confirmed using p7786[PDS].x = 0/1. The "Generate report" function is then automatically executed.
After the procedure has been completed, p7786[PDS] is automatically set = 0.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	Control Interface Module (CIM) replaced	Yes	No	-
01	Valve 1 replaced	Yes	No	-
02	Valve 2 replaced	Yes	No	-

Note: The firmware is automatically updated when the system boots. The boot can take several minutes.
After the update has been completed, it is necessary to carry out a new POWER ON (switch-off/switch-on) for the components involved.
The firmware update procedure is displayed as follows:
Control Unit (LED RDY):
Flashes yellow with 0.5 Hz --> firmware is being updated.
Flashing yellow with 2 Hz --> POWER ON is required for the components involved.
Components involved:
Flashing red/green with 0.5 Hz --> firmware is being updated.

011: DRIVE-CLiQ component has detected a checksum error.
015: The selected DRIVE-CLiQ components did not accept the contents of the firmware file.
018: Firmware version is too old and is not accepted by the component.
019: Firmware version is not suitable for the hardware release of the component.
101: After several communication attempts, no response from the DRIVE-CLiQ component.
140: Firmware file for the DRIVE-CLiQ component not available on the memory card/device memory.
143: Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.
144: When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card/device memory is defective.
145: Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.
156: Component with the specified component number is not available.
Additional values:
Only for internal Siemens troubleshooting.

Dependency: See also: p7828

Note: p7829 is automatically set to 0 after the firmware has been successfully downloaded.
The new firmware only becomes active at the next system run-up.

Description: Displays the actual serial number of the memory card.
The individual characters of the serial number are displayed in the ASCII code in the indices.

Dependency: See also: p9920, p9921

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

Note: Example: displaying the serial number for a memory card:

Description: Displays the version of the firmware stored on the memory medium of the converter.
Depending on the converter being used, the memory medium is a memory card (e.g. SINAMICS S120) - or the internal, non-volatile device memory (e.g. SINAMICS G120).

Index: [0] = Internal
[1] = External
[2] = Parameter backup
[3] = Motor data addon

Note: For index [0]:
Displays the internal firmware version (e.g. 04402315).
This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.
For index [1]:
Displays the external firmware version (e.g. 04040000 -> 4.4).
For automation systems with SINAMICS Integrated this is the runtime version of the automation system.
For index [2]:
Displays the internal firmware version of the parameter backup.
With this CU firmware version, the parameter backup was saved, which was used when powering up.
For index [3]:
Displays the version of the subsequently loaded motor database.
If there is no motor data available, then this index has a value of 0.

Min:	**Max:**	**Factory setting:**
-32786	32767	0

Description: Sets the global and unique component number in a drive system with several Control Units.
Each index of the parameter corresponds to a possible local component number on the corresponding Control Unit.
The indices are allocated to the global component numbers as follows:
p7859[0]: Not used
p7859[1]: Sets the global component number for the local component number 1
p7859[2]: Sets the global component number for the local component number 2
...
p7859[199]: Sets the global component number for the local component number 199

Notice: This parameter is preferably set via suitable commissioning tool (e.g. UpdateAgent, STARTER, SCOUT).
Changing the parameter via the AOP (Advanced Operator Panel) or BOP (Basic Operator Panel) can destroy a valid unique setting.

Note: The parameter is not influenced by setting the factory setting.

Description: Sets the priority for processing the existing drive objects in the system.
The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check.
With the factory setting the following priorities regarding processing are applicable:
- the drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK
- if they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.

Notice: This parameter may only be used by qualified service personnel.

Note: If the same drive object numbers are used and if the existing drive object numbers in the system are entered incompletely, the content of this parameter is ignored entirely. The behavior as with factory setting will then become effective.

Min:	**Max:**	**Factory setting:**

Description: Displays the sampling times currently present on the drive unit.
r7901[0...63]: sampling times of hardware time slices.
r7901[64...82]: sampling times of software time slices.
r7901[x] = 0, means the following:
No methods have been registered in the time slice involved.

Note: The basis for the software time slices is T_NRK = p7901[15].

r7903 Hardware sampling times still assignable / HW t_samp free

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410

Description: Displays the number of hardware sampling times that can still be assigned.
These free sampling times can be used by technology functions such as TEC, DCC or FBLOCKS.

Note: TEC: Technology Extension
DCC: Drive Control Chart
FBLOCKS: free blocks

The displayed value depends on the following:
The specific CU version (Sinamics S provides more sampling times than Sinamics G/DCM);
The sampling times that existed in the system up until now;
The internally reserved sampling times.

Additional application and system-dependent criteria must be taken into consideration for the possibility of registering an OA runtime group or a clock cycle change.

Bit 0: Generic error.
0 signal: No error present.
1 signal: Generic error present.
Bit 1 ... 3: Not supported (always a 0 signal).
Bit 4: Communications error.
0 signal: There is no message in the range 8700 ... 8799.
1 signal: There is at least one message (fault or alarm) in the range 8700 ... 8799.
Bit 5 ... 6: Not supported (always a 0 signal).
Bit 7: Fault outside the range 8700 ... 8799.
0 signal: There is no fault outside the range 8700 ... 8799.

Min:	**Max:**	**Factory setting:**
0000 hex	FFFF FFFF hex	0000 hex

Description: Sets the COB-ID for the emergency message (error telegram).
It corresponds to the CANopen objects:
- 1014 hex: COB-ID

Note: If, when downloading, the pre-set value 0 is downloaded, then the CANopen pre-set value 80 hex + Node-ID is automatically set.
Online, the value 0 is rejected as, according to the CANopen Standard, COB-ID 0 is not permitted here.
The changeover of the node ID using the hardware switch at the Control Unit or per software has no effect on the COB-ID EMCY. The saved value remains effective.

p8604[0...1] CAN life guarding / Life guarding

CU_S120_PN (CAN), CU_S150_PN (CAN), CU_S120_DP (CAN), CU_S150_DP (CAN)

P group: -	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0	65535	0

Description: Sets the life guarding parameter for the following CANopen objects:
- 100C hex: Guard Time
- 100D hex: Life Time Factor

The life time is derived by multiplying guard time by the life time factor.

Index: [0] = Time interval [ms] for the life time
[1] = Factor for the life time

Dependency: See also: p8606
See also: F08700

Note: For p8604[0] = 0 and/or p8604[1] = 0, the life guarding event service (monitoring the node guarding, fault F08700 with fault value = 2) is deactivated.
The node guarding protocol is active without the life guarding event service, if the heartbeat protocol is activated (p8606 > 0).
The life guarding event service is deactivated in the first commissioning.

p8606 CAN Producer Heartbeat Time / Prod Heartb Time

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0 [ms]	65535 [ms]	0 [ms]

Description: Sets the time [ms] to cyclically send heartbeat telegrams.
The smallest cycle is 100 ms.
For p8606 = 0, heartbeat telegrams are not sent.

Dependency: See also: p8604

Note: Corresponds to the CANopen object 1017 hex.
Activating the heartbeat protocol automatically deactivates the node guarding.

r8607[0...3] CAN Identity Object / Identity object

Description: General device information display.

Index: [0] = Vendor ID
[1] = Product code
[2] = Revision number
[3] = Serial number

Note: Corresponds to the CANopen object 1018 hex.
For index [3]:
The SINAMICS serial number comprises 60 bits.
Of these bits, the following are displayed in this index:
Bits 0 ... 19: Consecutive number
Bits 20 ... 23: Production ID
- 0 hex: Development
- 1 hex: P1 unique number
- 2 hex: P2 unique number
- 3 hex: WA unique number
- 9 hex: Pattern
- F hex: All others

Bits 24 ... 27: Month of manufacture (0 means January, B means December)
Bits 28 ... 31: Year of manufacture (0 means 2002)

Description: As a result of a Bus Off error, the CAN controller is set into the initialization state.
For index [0]:
The CAN controller is manually started after resolving the cause of the error with p8608[0] = 1
For index [1]:
The automatic CAN bus start function is activated using p8608[1] = 1.
At 2 second intervals, the CAN controller is automatically restarted until the cause of the error has been resolved and a CAN connection has been established.

Value:
0: Inactive
1: Start CAN controller

Index: [0] = Manual controller start function
[1] = Activating the automatic controller start function

Note: For index [0]:
This parameter is automatically reset to 0 after start.

Description: Sets the behavior of the CAN node referred to the communications error or equipment fault.

Value:
0: Pre-operational
1: No change
2: Stopped

Index: [0] = Behavior for communication errors
[1] = Behavior for device faults

Note: Corresponds to the CANopen object 1029 hex.

Description: Displays the identifier (client/server and server/client) of the SDO channel.

Index: [0] = COB-ID from the client to the server
[1] = COB-ID from the server to the client

Dependency: See also: p8612

Note: Corresponds to the CANopen object 1200 hex.
SDO: Service Data Object

p8611[0...82] CAN Pre-defined Error Field / Pre_def err field

CU_S120_PN (CAN), CU_S150_PN (CAN), CU_S120_DP (CAN), CU_S150_DP (CAN)

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0000 hex	FFFF 1000 hex	0000 hex

Description: Displays the Pre-defined Error Field of the CAN node.

It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history.

The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code.

Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code.

CANopen error code:

0000 hex: No error present.

8110 hex: Alarm A08751 present.

8120 hex: Alarm A08752 present.

8130 hex: Alarm A08700(F) with alarm value = 2 present.

1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799)

1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700)

All drive objects are acknowledged by writing the value 0 to index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

Index:
[0] = Number of all faults in the drive unit
[1] = Actual drive number/fault number

Description: Sets the identifier (client/server and server/client) of the additional SDO server.

Using these SDO servers, it is possible to access manufacturer-specific CANopen objects of the supported drive objects.

Index: [0] = COB-ID drive object from the client to the server
[1] = COB-ID drive object from the server to the client

Dependency: See also: r8610

Note: SDO: Service Data Object

Regarding the drive object Control Unit:

- Corresponds to the CANopen object 1201 hex

Regarding the drive object with closed-loop control functions:

- Corresponds to the CANopen object 1202 hex + 1 * x (x: Drive number 0 ... 7)

Description: Display or setting of the CANopen Node ID.
The Node ID can be set as follows:
1) Using the address switch on the Control Unit.
--> p8620 can then only be read and displays the selected Node ID.
--> A change only becomes effective after a POWER ON.
--> CANopen Node ID and PROFIBUS address are identical.
2) Using p8620
--> Only if address 0 is set using the address switch.
--> the Node ID is set as standard to 126.
--> A change only becomes effective after save and POWER ON.

Dependency: See also: r8621

Note: Every node ID change only becomes effective after a POWER ON.
The active node ID is displayed in r8621.
The parameter is not influenced by setting the factory setting.
It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

Description: Setting the bit rate for the CAN bus.
The appropriate bit timings are selected that are defined in p8623 in the associated sub-index.
Example:
Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6].

Value:
0: 1 Mbit/s
1: 800 kbit/s
2: 500 kbit/s
3: 250 kbit/s
4: 125 kbit/s

[7] 0004 1C2B hex

Description: Sets the bit timing for the C_CAN controller to the associated and selected bit rate (p8622).
Bits are distributed to the following parameters of the C_CAN controller in p8623[0...7]:
Bit 0 ... 5: BRP (Baud Rate Prescaler)
Bit 6 ... 7: SJW (Synchronization Jump Width)
Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point)
Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point)
Bit 15: Reserved
Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension)
Bit 20 ... 31: Reserved
Example:
Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6

Recommendation: Use the factory setting when setting the bit timing.

For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Note: The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer.

For SINAMICS S120 with CBC10, the PZD interface IF2 is used:

BI: p0840.0 = r889x.0

BI: p0844.0 = r889x.1

BI: p0848.0 = r889x.2

BI: p0852.0 = r889x.3

BI: p2103.0 = r889x.7

For SINAMICS S110, the PZD interface IF1 is used:

BI: p0840.0 = r209x.0

BI: p0844.0 = r209x.1

BI: p0848.0 = r209x.2

BI: p0852.0 = r209x.3

BI: p2103.0 = r209x.7

The write access is rejected if a CANopen control word is not mapped at one of these locations.

This causes the commissioning tool to interrupt the project download.

12: Project 12 participants, 24 words
16: Project 16 participants, 16 words
64: Project 64 participants, 16 words

Note:
SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
The parameter must be set the same for all participants.
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.

For index [1]:
Possible values: 500, 1000, 2000 µs

Index:
[0] = Activate isochronous mode
[1] = Bus CC [µs]

Dependency:
See also: p8811

Note:
SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.
For index [0]:
Is applicable for the synchronization of the application. The SINAMICS Link itself is always synchronous.
For index [1]:
The value must be set the same for all participants.
When newly selecting the project p8811, p8812[1] is set to the factory setting.
For p8811 = 8, 12, 16 the following applies:
Min/max/factory setting: 500/500/500 µs
For p8811 = 64, the following applies:
Min/max/factory setting: 1000/2000/2000 µs

[1] = PROFIsafe

Dependency:
See also: p8839

Note:
A change only becomes effective after POWER ON, reset or project download.
Example:
p8815[0] = 1: IF1 supports the isochronous mode.
p8815[1] = 2: IF2 supports PROFIsafe.

p8836 = 0: SINAMICS Link deactivated
p8836 = 1 ... 64: SINAMICS Link node address

Dependency: See also: p8811, p8835

Note: The maximum number of permitted participant addresses is limited by the project selection p8811.
SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).
A change only becomes effective after a POWER ON.
The parameter is not influenced by setting the factory setting.

p8837 IF2 STW1.10 = 0 mode / IF2 STW1.10=0

P group: Communications	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0	2	2

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".

Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value:
0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommendation: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

Description: Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).

Value:
0: Inactive
1: Control Unit onboard
2: COMM BOARD
99: Automatic

Index:
[0] = Interface 1
[1] = Interface 2

Dependency: See also: p2030, p8815

Note: For value = 99 (automatic) the following applies:

- if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1.

- if a CBE20 is inserted, then the following applies:

-- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2.

-- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2.

- CAN CBC10 always communicates via IF2.

For a value not equal to 99 (automatic) the following applies:

- both indices must be set to a number not equal to 99 (automatic).

A change only becomes effective after POWER ON, reset or download.

p8840 COMM BOARD monitoring time / CB t_mon

CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0 [ms]	65535000 [ms]	20 [ms]

Description: Sets the monitoring time to monitor the process data received via COMM BOARD.

If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.

Dependency: See also: p8835

Note: This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus.
For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4, 5).
For CBE20 firmware version Modbus TCP (p8835 =5) then the fieldbus data traffic is also monitored.
Value = 0: Monitoring is deactivated.

Description: Sets the send configuration data for the COMM BOARD.
The setting is activated with p8842.

Dependency: See also: p8842

Note: The configuration data are specific to the inserted COMM BOARD.
For CBE20, the configuration data are not relevant.

Description: Activate a modified send configuration for COMM BOARD.
With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.

Dependency: See also: p8841

Note: For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted.
For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3).

Description: Status display for COMM BOARD.

Value:
0: No initialization
1: Fatal fault
2: Initialization
3: Send configuration
4: Receive configuration
5: Non-cyclic communication
6: Cyclic communications but no setpoints (stop/no clock cycle)
255: Cyclic communication

Note: For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3).
For firmware version "PROFINET Device" or "EtherNet/IP" (p8835 = 1, 4), parameter p8956 should be observed.

Description: Displays the COMM BOARD diagnostics data.

Note: The display depends on the COMM BOARD being used.
For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4).
Example for CBE20:
r8858[0] = 4201 --> Siemens CBE20
r8858[1] = 3 --> firmware version = SINAMICS Link (see p8835)
r8858[2 ... 39] --> only for internal Siemens diagnostics.

Dependency: See also: p8900, p8901, p8902, p8903, p8904
See also: A08561

Note: When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8905 is set = 1 or 2.
For p8905 = 1:
The interface configuration (p8900 and following) is activated.
For p8905 = 2:
The interface configuration (p8900 and following) is activated and saved to non-volatile memory.
For p8905 = 3:
The interface configuration is reset to the factory setting at all points.
The factory settings for the interface configuration are loaded on activation (p8905 = 1) or at the next POWER ON.

Description: Sets the maximum telegram length for the Ethernet connection to a commissioning tool (e.g. STARTER, Startdrive, HMI).

Value:
0: 240 bytes
1: 480 bytes
2: 960 bytes

Note: The parameter is effective for Ethernet interfaces (Ethernet X127, PROFINET X150, PROFINET CBE20 X1400).
The telegram length actually used is negotiated between the participants.
We recommend that the telegram length is reduced to 240 bytes in the following cases:
- problems when operating with routed connections.
- operation with a SINUMERIK 840D.
A change only becomes effective after a POWER ON or reset.
The parameter is not influenced by setting the factory setting.

p8925 is automatically set to 0 at the end of the operation.

Value:
0: No function
1: Activate configuration
2: Activate and save configuration
3: Delete configuration

Dependency: See also: p8920, p8921, p8922, p8923, p8924
See also: A08563

Notice: When the DHCP mode is active (p8924 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.

Note: When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8925 is set = 1 or 2.
For p8925 = 1:
The interface configuration (p8920 and following) is activated.
For p8925 = 2:
The interface configuration (p8920 and following) is activated and saved to non-volatile memory.
For p8925 = 3:
All storage locations for the interface configuration are restored to the factory setting.
The factory settings for the interface configuration are loaded on activation (p8925 = 1) or at the next POWER ON.

12: Configured controller STOP
13: Configured controller RUN

Index:
[0] = Controller 1
[1] = Controller 2

Dependency: See also: r8961, r8962

Note: The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).

For PROFINET, the following applies:

For two connections (Shared Device or system redundancy) the display in the index depends on the sequence in which the connections are established.

The IP addresses of controllers 1 and 2 are displayed in r8961 and r8962.

The following states are displayed for system redundancy:

Primary controller: r8936[x] = 13

Backup controller: r8936[x] = 11

If value = 10:

If the connection remains in this state, then when using PROFINET IRT the following can apply:

- topology error (incorrect port assignment).
- synchronization missing.

For EtherNet/IP, the following applies:

Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

[5] = Connection type (RT, IRT)

Note: The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).
For PROFINET, the following applies:
For index [5]:
Bit 0 = 1: there is at least one RT connection.
Bit 1 = 1: there is an IRT connection.
For EtherNet/IP, the following applies:
For index [1, 3, 5]:
These indices are not relevant.

For PROFINET, the following applies:
If value = 10:
If the connection remains in this state, then when using PROFINET IRT the following can apply:
- topology error (incorrect port assignment).
- synchronization missing.
For EtherNet/IP, the following applies:
Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

Description: The setting to activate/deactivate SNMP for the Industrial Ethernet interface (X127) and the onboard PROFINET interface (X150).
Facilitates SNMP access for network diagnostic tools (e.g. PRONETA).

Value:
0: No
1: Yes

Notice: When SNMP is activated, carefully note the impact relating to Industrial Security.

Note: SNMP: Simple Network Management Protocol
A change only becomes effective after a POWER ON or reset.
The setting is only active on onboard interfaces (X127/X150).
For PROFINET CBExx, SNMP is always activated.

After initiating a function, the parameter is automatically reset again.
Example:
- set the component number (p9210).
- select the "flashing on" function (set p9211 = 1).

Value:
-1: Select function
0: Flashing off
1: Flashing on

Dependency: See also: p9210

Notice: If a task cannot be executed (e.g. the component number in p9210 does not exist), the following applies:
- there is no negative feedback signal.
- the value is reset anyway.

Description: Displays the statistics for the acyclic DRIVE-CLiQ communication of a component.
The component is preset in p9221.
The entry comprises the following elements:
Index 0: Parameter Id.
Index 1: Number of messages sent.
Index 2: Minimum time of all acyclic tasks referred to parameter Id (index 0).
Index 3: Maximum time of all acyclic requests referred to the parameter Id (index 0).
Index 4: Average of all acyclic requests referred to the parameter Id (index 0).
The time unit is 10 µs.

Dependency: The number of statistic entries is displayed in p9220.
In p9221, the component Id can be set whose statistic is to be displayed.
See also: r9220, p9221

Note: As a statistic entry comprises 5 data, when calling the entries via the terminal, a size that represents a multiple of 5 must be specified.
Example:
The 2nd entry should be called:
rdp 1 9222 5 5
or
rdpa 1 9222 5 5

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.
The value should be set so that it is precisely at 2^n revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.
The modulo function is deactivated for a value = 0.

Dependency: See also: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output.
If the absolute position is not enabled, then the parameterized modulo value is not taken into account.
This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SLP: Safely-Limited Position
SP: Safe Position

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-

Dependency: See also: C01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)
For bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
For bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.
Setting criteria if the motion monitoring functions are executed with an encoder.
- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: See also: r9713

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The parameter is only effective when PROFIsafe telegram 901 is selected.

By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.

If, during operation, a position actual value is determined that cannot be scaled to 16 bits, then message C30711 is output with value 7001 - along with the STOP F safety stop response.

Description: Sets the delay time, after which the stop response parameterized in p9612 for bus failure is executed.

Dependency: See also: p9363

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F).

The main use of the wait time is the function "Extended stopping and retraction" (ESR).

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

P group: Safety Integrated	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
-1	4	-1

Description: Sets the tolerance of the plausibility monitoring of the current and voltage angle.
A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.
An increase is advantageous, if the current or voltage at the motor become small.

Dependency: See also: p9507
See also: F30681, C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
Reducing this value can have a negative impact on the actual value sensing and the plausibility check.
When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For synchronous motors, the value 4 must be set.
If value = -1:
- for synchronous motors, the calculation is automatically made with the value 4.
- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.
The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: See also: C30711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Min:	**Max:**	**Factory setting:**
0.00 [µs]	100000.00 [µs]	25000.00 [µs]

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
A longer filter time results in a longer response time.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The smoothing is realized with a 1st order lowpass filter
For p9387 = minimum value, the filter is deactivated.
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0.00 [%]	1000.00 [%]	10.00 [%]

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).
- the value must be increased if C30711 has occurred with message value 1042.
- the value must be decreased if C30711 has occurred with message value 1041.
For synchronous motors, the following condition must be fulfilled:
|p0305 x p9783| >= p9388 x 1.2

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: See also: r9785
See also: C30711
Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.
Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Data type: FloatingPoint32	**Dyn. index:** -	**Function diagram:** -
P group: Safety Integrated	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
10.00 [%]	3300.00 [%]	100.00 [%]

Description: Sets the acceleration limit to filter velocity fluctuations.
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.
If this value is decreased, and this dampens the velocity peaks when accelerating.
- the value must be increased if C30711 with message value 1043 has occurred.
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.
Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.
To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.
Dependency: See also: r9784
See also: C30711
Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.
Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9389 = maximum value, the filter is deactivated.
Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.
The value should be set so that it is precisely at 2^n revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.
The modulo function is deactivated for a value = 0.

Dependency: See also: p9501
See also: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.
If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

Note: SLP: Safely-Limited Position
SP: Safe Position

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-

Dependency: See also: C01711

Notice: For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)
For bit 00:
For bit = 1 and with the SSM safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.
For bit = 0 and with the SSM safety function activated, the following applies:
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.
For bit 08:
For bit = 1 and with the SDI safety function activated, the following applies:
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.
For bit = 0 and with the SDI safety function activated, the following applies:
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description: Setting for isochronous communication between PROFIdrive controller and Control Unit.
The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1).
If a PROFIdrive controller exchanges process data isochronously with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data isochronously.
Examples for isochronous communication:
- isochronous control for the motion control (e.g. SIMOTION).
- isochronous PROFIsafe master (e.g. SIMATIC S7-400F).

Value: 0: Communication not isochronous
1: Communication isochronous

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.
Setting criteria if the motion monitoring functions are executed with an encoder.
- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: See also: p0115
See also: F01652

Note: The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1).
The monitoring clock cycle from p9500 must be an integer multiple of this parameter.
In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.
The clock cycle time of the actual value sensing should not be set to more than 8 ms.
A change only becomes effective after a POWER ON.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	Encoder rotating/linear	Linear	Rotating	-
01	Position actual value sign change	Yes	No	-
04	No STOP A after encoder fault for 1 encoder safety	Yes	No	-

Dependency: See also: p0404, p0410

See also: F01671

Note: For safety functions that are not enabled (p9501 = 0), the following applies:
- p9516.0 is automatically set the same as p0404.0 when the system boots.
- p9516.1 is automatically set the same as p0410.1 when the system boots.

For safety functions that are enabled (p9501 > 0), the following applies:
- p9516.0 is checked to identify whether it matches p0404.0.

Description:

Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

Min:	**Max:**	**Factory setting:**
0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]

Description: Sets the switchover velocity to SOS/SLS level.

Below this velocity limit, for a transition to SOS/SLS level, standstill (zero velocity) is assumed.

The transition times from STOP C, D, E and the delay time when selecting SOS are canceled if this velocity threshold is fallen below. The wait time from p9569 is started, and after it has expired, SOS is active.

The transition time from a higher to a lower safety-limited velocity level is canceled when this velocity level is fallen below. The wait time from p9569 is started, and after it has expired, the new SLS level becomes active.

For a STOP C, this switchover velocity is the only criterion for prematurely activating an SOS. In the other cases mentioned here, it must first have been signaled that the axis had correctly braked.

Dependency: See also: p9501, p9551, p9552, p9553, p9554

Note: With p9567 = 0, reducing the wait time for the transition to SOS/SLS level is deactivated.

Description: Sets the velocity limit for the "SAM" and "SBR" functions.

If the drive is being ramped down, but accelerates by the tolerance in p9548/p9348, then the SAM function identifies this and a STOP A is initiated.

The monitoring operates as follows:

- monitoring by SAM is activated for SS1 (or STOP B) and SS2 (or STOP C).
- the SAM limit value is frozen after the velocity limit in p9568/p9368 is undershot.
- SAM monitoring is still executed until the transition time to SOS/STO has expired.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)

Description: Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.

Dependency: See also: r9713

Note: The parameter is only effective when PROFIsafe telegram 901 is selected.

By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.

If, during operation, a position actual value is determined that cannot be scaled to 16 bits, then message C0711 is output with value 7001 - along with the STOP F safety stop response.

Description: Sets the monitoring time to define the brake ramp.
The rate of rise of the brake ramp depends upon p9581 (reference value) and p9583 (monitoring time).

Dependency: See also: p9581, p9582

Note: The set time is rounded internally to an integer multiple of the monitoring clock cycle.

P group: Safety Integrated	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
-1	4	-1

Description: Sets the tolerance of the plausibility monitoring of the current and voltage angle.
A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.
An increase is advantageous, if the current or voltage at the motor become small.

Dependency: See also: r9787
See also: F01681, C01711

Notice: Reducing this value can have a negative impact on the actual value sensing and the plausibility check.
When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For synchronous motors, the value 4 must be set.
If value = -1:
- for synchronous motors, the calculation is automatically made with the value 4.
- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.
The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: See also: C01711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: A longer filter time results in a longer response time.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
The smoothing is realized with a 1st order lowpass filter
For p9587 = minimum value, the filter is deactivated.
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
0.00 [%]	1000.00 [%]	10.00 [%]

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).
- the value must be increased if C01711 has occurred with message value 1042.
- the value must be decreased if C01711 has occurred with message value 1041.
For synchronous motors, the following condition must be fulfilled:
|p0305 x p9783| >= p9588 x 1.2

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: See also: r9785
See also: C01711

Notice: If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min:	**Max:**	**Factory setting:**
10.00 [%]	3300.00 [%]	100.00 [%]

Description: Sets the acceleration limit to filter velocity fluctuations.

If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.

If this value is decreased, and this dampens the velocity peaks when accelerating.

- the value must be increased if C01711 with message value 1043 has occurred.

- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: See also: r9784

See also: C01711

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9589 = maximum value, the filter is deactivated.

Diagnostics parameter p9784 must be used to correctly set this parameter.

Dependency: See also: p9802

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

Description: Sets the delay times for activating and deactivating the Safe Brake Adapter relay.
The relay-specific minimum delay times for evaluating the feedback signal contacts have to be set. They differ for the activation and deactivation of one and the same relay.

Index: [0] = Wait time activation
[1] = Wait time deactivation

Dependency: See also: p9822

Note: For a data cross-check between p9622 and p9822, a difference of one Safety monitoring clock cycle is tolerated.
The set time is rounded internally to an integer multiple of the monitoring clock cycle.
For index [0]:
Wait time switch on = drop-out time + bounce time NO contact + effect of the free-wheeling diode in the Safe Brake Adapter
For index [1]:
Wait time switch off = response time + bounce time NC contact + effect of the free-wheeling diode in the Safe Brake Adapter

Note: The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.
Example:
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.
The set debounce time impacts the response time of the safety function.

Description: Sets the debounce time for the failsafe digital inputs used to control STO/SBC/SS1.

Notice: To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]:
- if p0799[0] is less than 1 ms, then p9651 = 1 ms or a multiple integer of 1 ms.
- if p0799[0] is greater or equal to 1 ms, then p9651 must = p0799[0] - or must be a multiple integer of p0799[0].

Note: The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.
Example:
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Description: Sets the delay time for STO for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).

Recommendation: The delay time should be set as follows so that the drive can completely decelerate along the OFF3 ramp before the transition into STO:

Delay time >= p1135 + p1228

Dependency: See also: p1135, p9852

Note: Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9612 = 1).

Description: Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).

Recommendation: In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows:

Motor holding brake parameterized: delay time >= p1135 + p1228 + p1217

Motor holding brake not parameterized: delay time >= p1135 + p1228

Dependency: See also: p1135, p9852

Note: SS1: Safe Stop 1

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

SS1E requires the externally initiated stop in order to be in conformance with stop Category 1.

With this parameter, a switchover is made from SS1 to SS1E, and the drive-based braking response of function SS1 (time controlled) of the Basic Functions is deactivated.

Description: Displays the velocity resolution for safety-relevant motion monitoring functions.

For index [0]:

Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect.

For index [1]:

Displays the safe velocity accuracy based on the safe encoder accuracy

Index: [0] = Actual velocity resolution
[1] = Minimum velocity resolution

Note: For index [0]:

This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used.

Conversion of:

(internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle).

Example:

For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained.

For index [1]:

- for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only

Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary).

- for safety without encoder, index 1 is not relevant, and is always the value of zero.

Description: Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions.

Contrary to the parameterization of the SI limit values, this parameter specifies the actuator-side limit value and not the load-side limit value.

Recommendation: For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized.

- CI: p1051 = r9733[0]

- CI: p1052 = r9733[1]

Additional limiting can also be activated using connector input p1085 and p1088.

Index: [0] = Setpoint limiting positive
[1] = Setpoint limiting negative
[2] = Setpoint limit absolute

Dependency: For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the actuator side)
For SDI negative: r9733[0] = 0
For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the actuator side)
For SDI positive: r9733[1] = 0
[x] = Selected SLS stage
Conversion factor from the actuator side to the load side:
- actuator = rotary and axis type = linear: p9522 / (p9521 x p9520)
- otherwise: p9522 / p9521
See also: p9531, p9533

Note: If the "SLS" or "SDI" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082.
The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722.

Note:

For bit 00:

When STO or "Safe power inhibit" is selected, the cause is displayed in bits 16 ... 21.

For bit 01:

- For p9772.1 = 1 and p9772.19 = 0, an STO from the Safety Basic functions is active.
- For p9772.1 = 1 and p9772.19 = 1, safe power inhibit is active, if safety functions without selection are activated via p9601.2/p9801.2 = 1 and p9601.5/p9801.5 = 1.

For bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

For bit 19:

With SMM with encoder no actual value sensing is possible on account of parking.

For Safety functions without selection, safe power inhibit to selected (p9772.19 = 1).

SMM: Safe Motion Monitoring

For bit 22 and 23:

These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Description: Sets the additional field-generating current for synchronous motors with sensorless actual value sensing.
The set value is referred to p0305.
This parameter ensures a "base load" for the motor.
The value must fulfill the following condition:
|p0305 x p9783| >= p9588 x 1.2

Dependency: See also: p9588
See also: C01711

Notice: Reducing this percentage value can adversely affect actual value sensing with synchronous motors.
If the value is increased, this results in an increased motor power loss.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9783 = maximum value, current injection is deactivated.
Current injection is not effective in the U/f control mode.

Description: Displays the acceleration resolution (load side) for the "SLA" function.
Setpoints for acceleration limits or parameter changes for acceleration levels below this threshold have no effect.

Index: [0] = Coarse resolution
[1] = Fine resolution

Note: This parameter does not provide any information about the actual accuracy of the acceleration sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used.
Conversion of:
(internal fixed value/ Tsi²) to m/s² (linear) or 1/s² (rotary) with Tsi = p9500 (SI motion monitoring clock cycle)
Example:
For Tsi = 12 ms, r9790[0] = 0.006944 m/s² (linear) or 0.019290 1/s² (rotary) is obtained.
For Tsi = 12 ms, r9790[1] = 0.000006944 m/s² (linear) or 0.000019290 1/s² (rotary) is obtained.
Result for a coarse resolution is 0.006944 m/s² (linear) - or 0.019290 1/s² (rotary).
Result for a fine resolution is 0.000006944 m/s² (linear) - or 0.000019290 1/s² (rotary).

Description: Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module.

0: Inhibit SBC

1: Enable SBC

Dependency: See also: p9602

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

Description: Sets the discrepancy time to change over the safety-related inputs (SGE) on the Motor Module/Hydraulic Module.
An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this discrepancy time.

Dependency: See also: p9650

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated.
Rounding effects can occur in the last decimal place of the parameterized time.
The set time is rounded internally to an integer multiple of the monitoring clock cycle.
SGE: Safety-related input (e.g. STO terminals)

Description: Sets the debounce time for the STO terminal of the Hydraulic Module.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: Rounding effects can occur in the last decimal place of the parameterized time.

The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

Description: Sets the delay time for STO for the function "Safe Stop 1" (SS1) on the Hydraulic Module to brake along the OFF3 down ramp (p1135).

Recommendation: The delay time should be set as follows so that the drive can completely decelerate along the OFF3 ramp:

Delay time >= p1135 + p1228

Dependency: See also: p1135, p9652

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9812 = 1).

Description: Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Motor Module to brake along the OFF3 down ramp (p1135).

Recommendation: In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows:
Motor holding brake parameterized: delay time >= p1135 + p1228 + p1217

If a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119). As a consequence, the drive can still be braked in a controlled fashion during this delay time.

Description: If, when comparing the actual topology and target topology, only error has occurred, that can be acknowledged, then using this parameter, a new comparison can be started - acknowledging the error in the target topology.

Differences that can be acknowledged:

- topology comparison, component shifted
- topology comparison, serial number of a component has been detected to be different (byte 3 = 1)
- topology comparison shows one component that is connected differently

The following parameter values are available:

p9904 = 1 --> the procedure is started.

p9904 = 0 after starting --> the procedure has been successfully completed.

p9904 > 1 after starting --> the procedure has not been successfully completed.

The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2.

Byte 2:

Number of structural differences.

Byte 3:

Number of differences that can be acknowledged (p9904).

Byte 4:

Number of differences. These differences can be resolved as follows:

- sets the topology comparison (p9906 or p9907/p9908).
- change over the actual topology.

The appropriate action should be selected corresponding to the message that is displayed/output.

Note: In order to permanently accept the acknowledgment of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).

Description: With p9905 = 1, the serial numbers and the hardware versions of all of the components are transferred from the actual topology into the target topology and a new comparison is started.

For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers.

With p9905 = 2, the serial numbers, the hardware versions and the article numbers of all of the components are transferred from the actual topology into the target topology and a new comparison is started.

For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers and article numbers.

Note: p9905 is automatically set to 0 at the end of the operation.

In order to permanently accept the data, it is necessary to save in a non-volatile fashion (p0977).

Description: Sets the type of comparison between the actual topology and target topology.
The comparison is started by setting the required value.

Value:
0: High: Compares the complete electronic rating plate
1: Medium: Compares the component type and the article number
2: Low: Compares the component type
3: Minimum: Compares the component class

Description: For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.
For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:
- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency: See also: p9904, p9905

Note: The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).
Special case for Control Unit and option slot modules:
When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.
With the STARTER commissioning tool, the ASCII characters are not entered coded, i.e. the license key characters can be entered as printed in the Certificate of License. In this case, the commissioning tool codes the characters.

Note: For an invalid license key, all the indices have the value 0 dec.
Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-").
When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec.
After entering the license key, the license key must be activated (p9921).
The following fault and LED indicate that the licensing is not adequate:
- F13000 --> licensing not adequate
- LED READY --> flashes red at approximately 2 Hz

Description: Sets the configuration for the DRIVE-CLiQ diagnostics (error counter r9936).
Using this function, connections and cables of DRIVE-CLiQ connections can be checked for transfer errors. The error counter is evaluated in the PHY blocks involved.

Bit array:

Bit	Signal name	1 signal	0 signal	FD
00	Alarm for connection error	Yes	No	-

Note: For bit 00:
To activate this function, p9938 must be set to 0 (inactive).
After changing the error counter (r9936), an appropriate alarm is output.
The alarm automatically disappears after 5 seconds.
For bit 08:
With p9937.8 = 1, the error counters are reset (r9936[0...199]).
After the reset, p9937.8 is automatically set to 0.

Description: Select a failsafe digital input (F-DI) for the signal "acknowledge internal event" (internal fault).
The signal is transferred to the corresponding control signal of all drives.
The falling edge at this input resets the status "internal event" in the drives.
The rising edge at this input acknowledges any existing discrepancy errors.

Description: Selects a failsafe digital input (F-DI) for the "SLP retract" function.

A rising edge at this F-DI makes it possible to retract the axis, if at this instant in time indicates a violation of the SLP limit.

After safe acknowledgment of the active safety faults, the drive can be traversed in the direction of the permitted position range.

In the retract mode, SLP becomes inactive, and SDI, if enabled, is selected in the direction of the permitted position range.

A 0 signal at the F-DI for retraction, deactivates the active retraction mode (SLP becomes active again, and SDI selected corresponding to the actual F-DIs).

Value:
0: Function inactive
1: F-DI 0
2: F-DI 1
3: F-DI 2

Note:

In this clock cycle, the debounced F-DIs (p10017) are evaluated, and converted over to SGEs.
In this clock cycle, also the F-DOs are controlled corresponding to the presently available SGAs.
This clock cycle corresponds to the smallest communication clock cycle that was entered in p10000[].
SGEs are transferred to the drives, and the SGAs received from the drives are transferred with the specific communication clock cycle of each drive in p10000[].
The value of a specific index of p10000[] represents the communication clock cycle of the drive, which is entered in the same index of p10010[].

The debounce time acts on the following digital inputs:
- Failsafe digital inputs (F-DI).
- Single-channel digital inputs (DI).
- Single-channel digital input 22 (DI 22, read back input for the forced checking procedure).

Dependency: See also: p10117

Notice: To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]:
- if p0799[0] is less than 1 ms, then p10017 = 1 ms or a multiple integer of 1 ms.
- if p0799[0] is greater or equal to 1 ms, then p10017 must = p0799[0] - or must be a multiple integer of p0799[0].

Note: Example:
Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.
Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.
The debounce result can be read in r10051.
The set debounce time impacts the response time of the safety function.

Note: If a safety function is assigned to an input (e.g. via p10022), then the following applies:
- logical "0": Safety function is selected
- logical "1": Safety function is deselected

The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10040) of the input as NC contact or NO contact, and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, deselects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V deselects the safety function.

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:
- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Dependency: See also: p9501, p9601, p10117, p10140, p10150

Note: F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is deselected

The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10140) of the input as NC contact or NO contact, and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, deselects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V deselects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Description: Sets the effective holding torque on the motor side of the brake to be tested.

Index:
[0] = Brake 1
[1] = Brake 2

Dependency: The holding torque of an external brake should be converted to the motor side.
Conversion factor:
- motor type = rotary and axis type = linear: p9522 / (p9521 x p9520)
- otherwise: p9522 / p9521
Further, the efficiency of the mechanical system should be taken into account.
See also: p10210, p10220

Note: The test torque effective for the brake test can be set for each sequence using a factor (p10210, p10220).

2.4.1 Parameters with "WRITE_NO_LOCK"

The following list contains the parameters with the "WRITE_NO_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS S120/S150, Version: 5207347, Language: eng, Type: WRITE_NO_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev com par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0124[0...n]	Power unit detection via LED / PU detection LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0144[0...n]	Voltage Sensing Module detection via LED / VSM detection LED
p0154[0...n]	Voltage Sensing Module 2 detection via LED / VSM2 detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0154	DRIVE-CLiQ Hub Module detection via LED / Hub detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p1903	BI: Data identification control / Data ID ctrl
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3109	UTC synchronization tolerance / UTC sync tol
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p4700[0...1]	Trace control / Trace control
p4701	Measuring function control / Meas fct ctrl
p4703[0...1]	Trace options / Trace options
p4707	Measuring function configuration / Meas fct config
p4710[0...1]	Trace trigger condition / Trace Trig_cond
p4711[0...5]	Trace trigger signal / Trace trig_signal
p4712[0...1]	Trace trigger threshold / Trace trig_thr
p4713[0...1]	Trace tolerance band trigger threshold 1 / Trace trig thr 1
p4714[0...1]	Trace tolerance band trigger threshold 2 / Trace trig thr 2
p4715[0...1]	Trace bit mask trigger, bit mask / Trace trig mask
p4716[0...1]	Trace bit mask trigger trigger condition / Trace Trig_cond
p4717	Measuring function number of averaging operations / Meas fct avg qty
p4718	Measuring function number of stabilizing periods / MeasFct StabPerQty
p4720[0...1]	Trace recording cycle / Trace record_cyc
p4721[0...1]	Trace recording time / Trace record_time
p4722[0...1]	Trace trigger delay / Trace trig_delay
p4723[0...1]	Trace time slice cycle / Trace cycle

p4724[0...1]	Trace average in the time range / Trace average
p4730[0...5]	Trace record signal 0 / Trace record sig 0
p4731[0...5]	Trace record signal 1 / Trace record sig 1
p4732[0...5]	Trace record signal 2 / Trace record sig 2
p4733[0...5]	Trace record signal 3 / Trace record sig 3
p4734[0...5]	Trace record signal 4 / Trace record sig 4
p4735[0...5]	Trace record signal 5 / Trace record sig 5
p4736[0...5]	Trace record signal 6 / Trace record sig 6
p4737[0...5]	Trace record signal 7 / Trace record sig 7
p4780[0...1]	Trace physical address signal 0 / Trace PhyAddr Sig0
p4781[0...1]	Trace physical address signal 1 / Trace PhyAddr Sig1
p4782[0...1]	Trace physical address signal 2 / Trace PhyAddr Sig2
p4783[0...1]	Trace physical address signal 3 / Trace PhyAddr Sig3
p4784[0...1]	Trace physical address signal 4 / Trace PhyAddr Sig4
p4785[0...1]	Trace physical address signal 5 / Trace PhyAddr Sig5
p4786[0...1]	Trace physical address signal 6 / Trace PhyAddr Sig6
p4787[0...1]	Trace physical address signal 7 / Trace PhyAddr Sig7
p4789[0...1]	Trace physical address trigger signal / Trace PhyAddr Trig
p4795	Trace memory bank changeover / Trace mem chgov
p4800	Function generator control / FG control
p4810	Function generator mode / FG operating mode
p4812	Function generator physical address / FG phys address
p4813	Function generator physical address reference value / FG phys addr ref
p4815[0...2]	Function generator drive number / FG drive number
p4816	Function generator output signal integer number scaling / FG outp integ scal
p4819	BI: Function generator control / FG control
p4820	Function generator signal shape / FG signal shape
p4821	Function generator period / FG period duration
p4822	Function generator pulse width / FG pulse width
p4823	Function generator bandwidth / FG bandwidth
p4824	Function generator amplitude / FG amplitude
p4825	Function generator 2nd amplitude / FG 2nd amplitude
p4826	Function generator offset / FG offset
p4827	Function generator ramp-up time to offset / FG ramp-up offset
p4828	Function generator lower limit / FG lower limit
p4829	Function generator upper limit / FG upper limit
p4830	Function generator time slice cycle / FG time slice
p4831	Function generator amplitude scaling / FG amplitude scal
p4832[0...2]	Function generator amplitude scaling / FG amplitude scal
p4833[0...2]	Function generator offset scaling / FG offset scal
p4835[0...4]	Function generator free measurement function scaling / FG fr MeasFct scal
p4840[0...1]	MTrace cycle number setting / Cycle number
p7761	Write protection / Write protection
p7770	NVRAM action / NVRAM action
p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3

p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8835	CBE20 firmware selection / CBE20 FW sel
p8839[0...1]	PZD interface hardware assignment / PZD intf HW assign
p8840	COMM BOARD monitoring time / CB t_mon
p9210	Flashing component number / Flash comp_no
p9211	Flash function / Flash fct
p9484	BICO interconnections search signal source / BICO s_s srch

2.4.3 Parameters with "KHP_ACTIVE_READ"

The following list contains the parameters with the "KHP_ACTIVE_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS S120/S150, Version: 5207347, Language: eng, Type: KHP_ACTIVE_READ

2917 – Manufacturer-specific telegrams . . . 2277

3.18 Setpoint channel 2278
3001 – Overview 2279
3010 – Fixed speed setpoints 2280
3020 – Motorized potentiometer 2281
3030 – Main/supplementary setpoint, setpoint scaling, jogging 2282
3040 – Direction limitation and direction reversal 2283
3050 – Skip frequency bands and speed limitations 2284
3060 – Basic ramp-function generator 2285
3070 – Extended ramp-function generator 2286
3080 – Ramp-function generator selection, status word, tracking 2287
3082 – Extended Stop and Retract (ESR, r0108.9 = 1) 2288
3090 – Dynamic Servo Control (DSC) linear and DSC spline (r0108.6 = 1) 2289

3.19 Setpoint channel not activated 2290
3095 – Generation of the speed limits (r0108.8 = 0) 2291

3.20 Basic positioner (EPOS) 2292
3610 – Jog mode (r0108.4 = 1) 2293
3612 – Referencing/reference point approach mode (r0108.4 = 1) (p2597 = 0 signal) 2294
3614 – Flying referencing mode (r0108.4 = 1) (p2597 = 1 signal) 2295
3615 – Traversing block mode, external block change (r0108.4 = 1) 2296
3616 – Traversing block mode (r0108.4 = 1) 2297
3617 – Travel to fixed stop (r0108.4 = 1) 2298
3618 – Direct setpoint input/MDI mode, dynamic values (r0108.4 = 1) 2299
3620 – Direct setpoint input/MDI mode (r0108.4 = 1) 2300
3625 – Mode control (r0108.4 = 1) 2301
3630 – Traversing range limits (r0108.4 = 1) 2302
3635 – Interpolator (r0108.4 = 1) 2303
3640 – Control word block selection/MDI selection (r0108.4 = 1) 2304
3645 – Status word 1 (r0108.3 = 1, r0108.4 = 1) 2305
3646 – Status word 2 (r0108.3 = 1, r0108.4 = 1) 2306
3650 – Status word active traversing block/MDI active (r0108.4 = 1) 2307

3.21 Position control 2308
4010 – Position actual value preprocessing (r0108.3 = 1) 2309
4015 – Position controller (r0108.3 = 1) 2310
4020 – Standstill monitoring / positioning monitoring (r0108.3 = 1) 2311
4025 – Dynamic following error monitoring, cam controllers (r0108.3 = 1) 2312

3.22 Encoder evaluation 2313
4700 – Servo control, overview 2314
4702 – Vector control, overview 2315
4704 – Position and temperature sensing encoders 1 ... 3 2316
4710 – Speed actual value and pole position sensing encoders 1 2317
4711 – Speed actual value sensing encoders 2, 3 (r0108.7 = 1, APC activated) 2318
4715 – Speed actual value and pole position sensing encoders 1, n_act_filter 5 2319
4720 – Encoder interface, receive signals, encoders 1 ... 3 2320
4730 – Encoder interface, send signals, encoders 1 ... 3 2321
4735 – Reference mark search with external zero mark, encoders 1 ... 3 2322
4740 – Measuring probe evaluation, measured value memory, encoders 1 ... 3 2323
4750 – Absolute value for incremental encoder 2324

3.23 Hydraulic drive 2325
4965 – Velocity controller 2326
4966 – Transition point compensation 2327
4970 – Force controller 2328
4975 – Valve characteristic, plane adaptation 2329
4977 – Static friction compensation using a force controller (p1400.2 = 1) 2330
4978 – Static friction compensation via voltage pulse / voltage ramp 2331
4985 – Sequencer 2332
4990 – P24 management with shutoff valve 2333
4991 – P24 management without shutoff valve 2334

3.24 Servo control 2335
5019 – Closed-loop speed control and U/f control, overview 2336
5020 – Speed setpoint filter and speed precontrol 2337
5030 – Reference model/precontrol symmetrization/speed limitation 2338
5035 – Moment of inertia estimator (r0108.10 = 1, r0108.30 = 1) 2339
5040 – Speed controller with encoder 2340
5042 – Speed controller, torque/speed precontrol with encoder (p1402.4 = 1) 2341
5045 – Online tuning with activated moment of inertia estimator (r0108.10 = 1) 2342
5050 – Speed controller adaptation (Kp_n/Tn_n adaptation) 2343
5055 – Controller parameter adaptation (r0171.29 = 1) 2344
5060 – Torque setpoint, switchover control mode 2345
5210 – Speed controller without encoder 2346
5300 – U/f control for diagnostics 2347
5301 – Variable message function 1, 2, 3 2348

5490 – Closed-loop speed control configuration . . . 2349
5609 – Generation of the torque limits, overview . . . 2350
5610 – Torque limiting/reduction, interpolator . . . 2351
5620 – Motoring/generating torque limit . . . 2352
5630 – Upper/lower torque limit . . . 2353
5640 – Mode changeover, power/current limiting . . . 2354
5650 – Vdc_max controller and Vdc_min controller . . . 2355
5700 – Current control, overview . . . 2356
5710 – Current setpoint filter 1 ... 4 . . . 2357
5711 – Current setpoint filter 5 ... 10 (r0108.21 = 1) . . . 2358
5714 – Iq and Id controllers . . . 2359
5722 – Field current/flux input, flux reduction, flux controller . . . 2360
5730 – Interface to the Motor Module (gating signals, current actual values) . . . 2361

3.25 Vector control . . . 2362
6020 – Closed-loop speed control and generation of the torque limits, overview . . . 2364
6030 – Speed setpoint, droop . . . 2365
6031 – Precontrol symmetrization, reference/acceleration model . . . 2366
6035 – Moment of inertia estimator (r0108.10 = 1) . . . 2367
6040 – Speed controller with/without encoder . . . 2368
6050 – Speed controller adaptation (Kp_n/Tn_n adaptation) . . . 2369
6060 – Torque setpoint . . . 2370
6220 – Vdc_max controller and Vdc_min controller . . . 2371
6300 – U/f control, overview . . . 2372
6301 – U/f characteristic and voltage boost . . . 2373
6310 – Resonance damping and slip compensation . . . 2374
6320 – Vdc_max controller and Vdc_min controller (U/f) . . . 2375
6490 – Closed-loop speed control configuration . . . 2376
6491 – Flux control configuration . . . 2377
6495 – Excitation (SESM, p0300 = 5) . . . 2378
6630 – Upper/lower torque limit . . . 2379
6640 – Current/power/torque limits . . . 2380
6700 – Current control, overview . . . 2381
6710 – Current setpoint filter . . . 2382
6714 – Iq and Id controllers . . . 2383
6721 – Id setpoint (PMSM, p0300 = 2) . . . 2384
6722 – Field weakening characteristic, Id setpoint (ASM, p0300 = 1) . . . 2385

6723 – Field weakening controller, flux controller (ASM, p0300 = 1) . . . 2386
6724 – Field weakening controller (PMSM, p0300 = 2) . . . 2387
6725 – Flux setpoint, field weakening controller (SESM, p0300 = 5) . . . 2388
6726 – Field weakening controller, flux controller (SESM, p0300 = 5) . . . 2389
6727 – Current model, excitation current monitoring, control cos phi (SESM, p0300 = 5) . . . 2390
6730 – Interface to the Motor Module (ASM, p0300 = 1) . . . 2391
6731 – Interface to the Motor Module (PMSM, p0300 = 2) . . . 2392
6732 – Interface to the Motor Module (SESM, p0300 = 5) . . . 2393
6733 – Motor model selection (SESM and p1300 = 20, p0300 = 5) . . . 2394
6790 – Flux setpoint (RESM, p0300 = 6) . . . 2395
6791 – Id setpoint (RESM, p0300 = 6) . . . 2396

7020 – Synchronization . . . 2407
7033 – Essential service mode (ESM) . . . 2408

3.27 Technology controller . . . 2409
7950 – Fixed values, binary selection (r0108.16 = 1 and p2216 = 2) . . . 2410
7951 – Fixed values, direct selection (r0108.16 = 1 and p2216 = 1) . . . 2411
7954 – Motorized potentiometer (r0108.16 = 1) . . . 2412
7958 – Closed-loop control (r0108.16 = 1) . . . 2413
7959 – Kp/Tn adaptation (r0108.16 = 1) . . . 2414
7960 – DC-link voltage controller (r0108.16 = 1) . . . 2415

3.28 Line droop control (r0108.12 = 1) . . . 2416
7982 – Line droop, voltage correction control . . . 2417
7983 – Direct component control, harmonics control . . . 2418
7984 – Modulation depth control . . . 2419
7986 – Sequence control overcurrent . . . 2420

3.29 Line transformer (r0108.4 = 1) 2421
7987 – Direct component control, negative sequence system controller 2422
7988 – Island grid black start sequence control 2423
7989 – Island grid synchronization, sequence control 2424
7995 – Island grid synchronization, voltage threshold 2425
7990 – Transformer model (p5480 = 1) 2426
7991 – Line filter monitoring 2427
7992 – PLL2 (phase locked loop 2) 2428
7993 – Transformer magnetization, voltage threshold 2429
7994 – Transformer magnetization, sequence control 2430

3.30 Dynamic grid support (r0108.7 = 1) 2431
7996 – Characteristic 2432
7997 – Current limits (p5501 = 1) 2433
7998 – Sequence control 2434
7999 – Grid monitoring anti-islanding 2435

3.31 Signals and monitoring functions 2436
8005 – Overview 2437
8010 – Speed signals 1 2438
8011 – Speed signals 2 2439

Parameters

Symbol	Meaning
Parameter name [Unit] rxxxx[x]	Monitoring parameter with index [x].
Parameter name [Unit] rxxxx[x...y]	Monitoring parameter with index range [x...y].
[aaaa.b] Parameter name from ... to [Unit] pxxxx[y...z] (Def)	Setting parameter (if the parameter appears a multiple number of times, then diagram references are specified).
[aaaa.b] Parameter name from ... to [Unit] pxxxx[y] (Def)	Setting parameter with index (if the parameter appears a multiple number of times, then diagram references are specified).

Connectors

Symbol	Meaning
name pxxxx (xxxx)	Connector input CI.
name pxxxx[y] (xxxx [x])	Connector input CI with index [y].
name pxxxx[y...z] (xxxx [y])	Connector input CI with index range [y...z].
name [unit] rxxxx[y...z]	Connector output CO with [dimension unit] and index range [y...z].
name [unit] rxxxx[y]	Connector output CO [dimension unit] and with index [y].

CI: Connector Input
CO: Connector Output
CO/BO: Connector/Binector Output

Binectors

Symbol	Meaning
name pxxxx (Def)	Binector input BI with factory setting (Def).
name pxxxx[y] (Def)	Binector input BI with index [y] and factory setting (Def).
name pxxxx[y...z] (Def)	Binector input BI with index range [y...z] and factory setting (Def).
name rxxxx	Binector output BO.
name rxxxx.y	Binector output BO with bit y.

BI: Binector Input
BO: Binector Output

Connectors/binectors

Symbol	Meaning
Parameter name rxxxx / rxxxx	Connector/binector output CO/BO.

Cross references between diagrams

Symbol	Meaning
1 ... 8 Signal path 1 [aaaa.1] … Signal path 8 [aaaa.8]	The function diagrams are sub-divided into 8 signal paths in order to facilitate orientation.
Text → [aaaa.b]	Text = Unique signal designation aaaa = Signal goes to target diagram aaaa b = Signal goes to signal path b
[cccc.d] → Text	Text = Unique signal designation cccc = Signal comes from source diagram cccc d = Signal comes from signal path d

To "function diagram name" [aaaa.b] = for binectors.

Cross references for control bits

Symbol	Meaning
pxxxx [aaaa.b]	pxxxx = Original parameter of signal aaaa = Signal comes from source diagram aaaa b = Signal comes from signal path b

Data sets

Symbol	Meaning
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).

Information on parameters, binectors, connectors

Symbol	Meaning
Parameter name	Parameter name (up to 18 characters).
[Unit]	[dimension unit] rotatory axis, for linear axis see list of parameters.
rxxxx[y] or rxxxx[y...z] or rxxxx[y].ww or rxxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "[y]" specifies the valid index, "[y...z]" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).
pxxxx[y] or pxxxx[y...z] or pxxxx[y].ww or pxxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "[y]" specifies the applicable index, "[y...z]" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).
from ... to	Value range.
(xxxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.
(Def)	Factory setting.
(Def.w)	Factory setting with bit number as prefix.
[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]

Sampling times

Symbol	Meaning
pxxxx[Y] (ZZZ.ZZ µs)	Setting parameter with factory setting to select the time slice.
p0115[y] (Drive Object)	Time slice depending on the pre-setting p0112 of the drive object. "[y]" specifies the applicable index.
p0115[y] (Motor Modules)	Time slice depending on the rated pulse frequency of the motor module. "[y]" specifies the applicable index.
PROFIdrive sampling time	Pre-setting for IF1 in p2048. Pre-setting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.
CAN bus sampling time	Pre-setting in p8848.
Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.
Not relevant	A static state is displayed here. The sampling time data is not relevant.

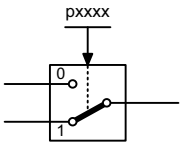
Switch symbol



Simple changeover switch

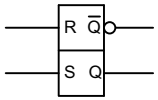
The switch position is shown according to the factory setting of pxxxx (in this case switch position 1).

Symbols for logic functions

NOT element
Logical inversion (negation).

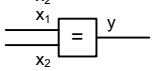
AND element
With logical inversion of an input.

OR element



R/S flip-flop
S/R = setting input/reset input
Q = non-inverted output
$\overline{Q}$ = inverted output
With a simultaneous 1-signal at the R and S inputs, the S input dominates.

Exclusiv-OR/XOR
y = 1 when $x_1 \neq x_2$ is.

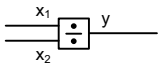


Comparator
y = 1 when $x_1 = x_2$ is.

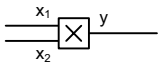
Symbols for computational and closed-loop control functions

Sign reversal
y = -x

Absolute value generator
y = |x|

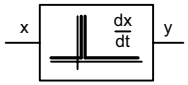


Divider
$y = \frac{x_1}{x_2}$



Multiplier
$y = x_1 * x_2$

Comparator
y = 1 if the analog signal x > 0, i.e. is positive.

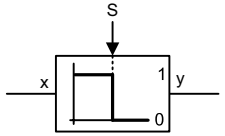


Differentiator
$Y = \frac{dx}{dt}$

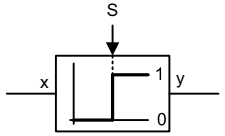
Symbol for monitoring

Monitoring
In the bottom right-hand corner of the diagram.

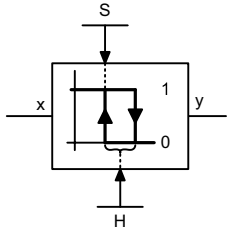
Symbols for computational and closed-loop control functions



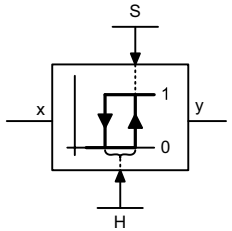
Threshold value switch 1/0
Outputs at y a logical "1" if x < S.



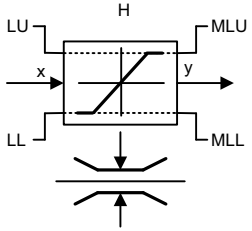
Threshold value switch 0/1
Outputs at y a logical "1" if x > S.



Threshold value switch 1/0 with hysteresis
Outputs at y a logical "1" if x < S.
If x >= S + H, then y returns to 0.



Threshold value switch 0/1 with hysteresis
Outputs at y a logical "1" if x > S.
If x <= S – H, then y returns to 0.



Limiter
x is limited to the upper limit LU and the lower limit LL and output at y.
The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

Sample & Hold element
Sample and hold element.
y = x if SET = 1
(not saved retentively at POWER OFF)

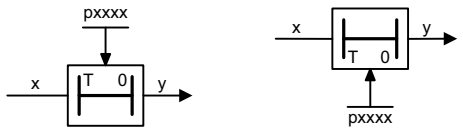
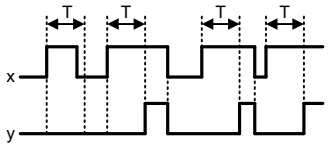
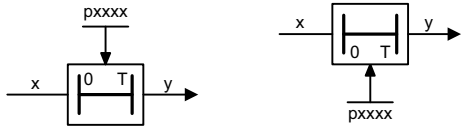
Switch-on delay



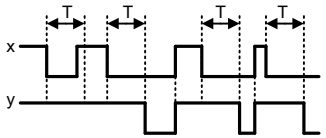
The digital signal x must have the value "1" without any interruption during the time T before output y changes to "1".



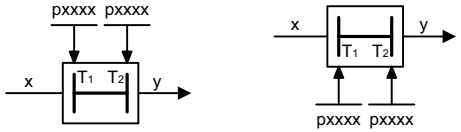
Switch-off delay



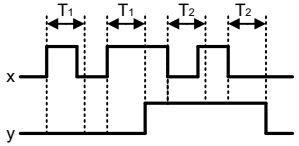
The digital signal x must have the value "0" without interruption during the time T before output y changes to "0".



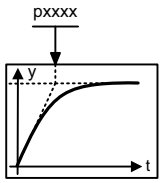
Delay (switch-on and switch-off)



The digital signal x must have the value "1" without interruption during time T_1 or must have the value "0" during time T_2 before output y changes its signal state.



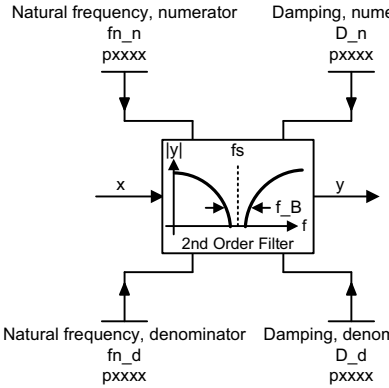
PT1 element



Delay element, first order.

pxxxx = time constant

2nd-order filter (bandstop/general filter)



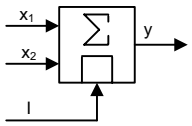
Used as bandstop filter - center frequency fs: $fn_n = fs$, $fn_d = fs$

- bandwidth f_B: $D_n = 0$, $D_d = \frac{f_B}{2 \cdot fs}$

Transfer function when used as general filter

$$H(s) = \frac{\left(\frac{s}{2\pi\, fn_n}\right)^2 + \frac{2 \cdot D_n}{2\pi\, fn_n} \cdot s + 1}{\left(\frac{s}{2\pi\, fn_d}\right)^2 + \frac{2 \cdot D_d}{2\pi\, fn_d} \cdot s + 1}$$

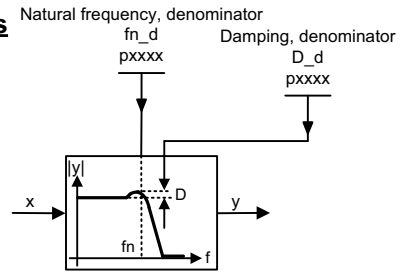
Analog adder can be activated



The following applies to I = 1 signal: $y = x_1 + x_2$

The following applies to I = 0 signal: $y = x_1$

PT2 low pass



Transfer function $H(s) = \frac{1}{\left(\frac{s}{2\pi\, fn_d}\right)^2 + \frac{2 \cdot D_d}{2\pi\, fn_d} \cdot s + 1}$

Fig. 3-4 1030 – Handling BICO technology

Handling BICO technology

Binector: r0723.15

Binectors are binary signals that can be freely interconnected (BO = Binector Output).
They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector: r0723

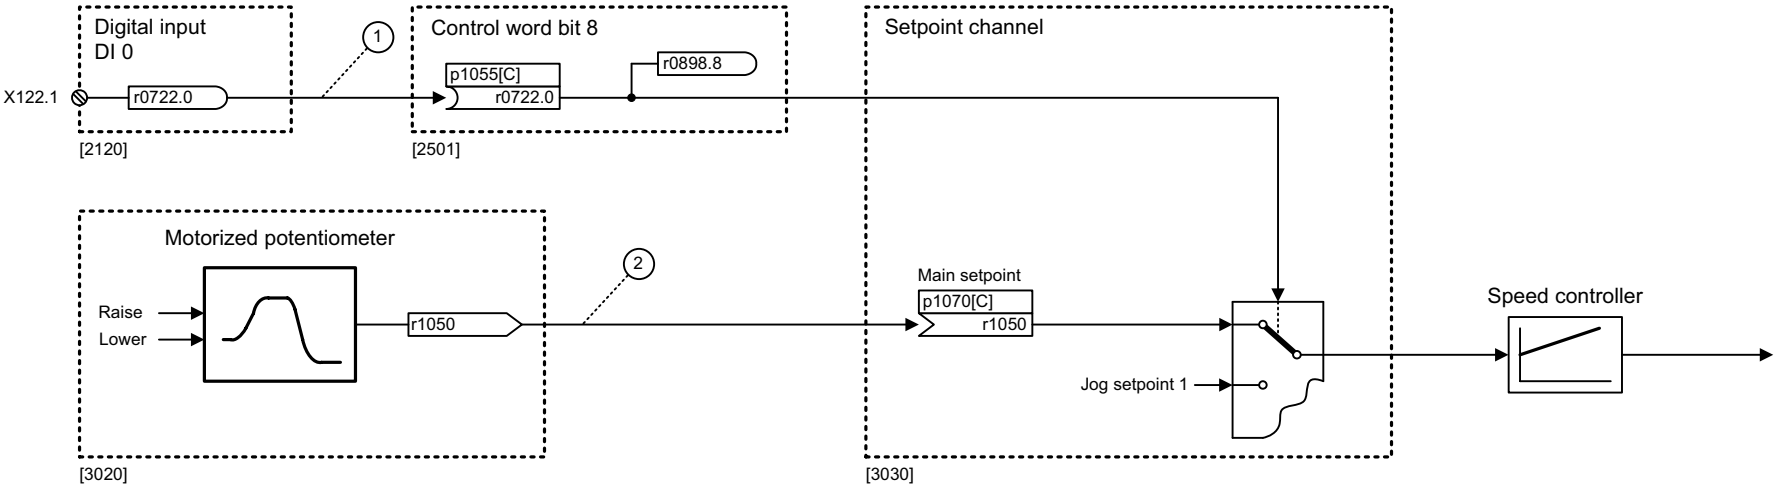
Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques).
Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
"BI:" parameter for binectors (BI = Binector Input)
or
"CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.



Parameterizing steps:

(1) p1055[0] = r0722.0 Terminal X122.1 acts as "Jog bit 0".

(2) p1070[0] = r1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> Differential input!
In case of a ground-based input signal, the terminal X131.8 must be connected to the reference potential M.
Caution:
The voltage between an input (X131.7 or X131.8) and the grounding point must not exceed 35 V.
When the load resistor is switched in (S5.0 closed), the voltage between the input terminals must not exceed 15 V.

<1> The configuration parameters must be set to the same values for all nodes (exception: p8836, p8839[0, 1]).
<2> All changes become effective after POWER ON only.
<3> The following applies for the node address: Address 1 must be provided and gaps are not permissible.

<1> A pair of values p8870[Index], p8872[Index] may only be used once in a device.
<2> All changes become effective with p8842 = 1. Afterwards, p8842 = 0 is automatically set.
A change can also be activated via warm restart, project download or POWER ON.
<3> The number of process data n (PZD) depends on the drive object.

<1> The number of PZD send words depends on the drive object type.
<2> A PZD send word can either be supplied via connector input p8851[x] (WORD) or via p8861[x] (DWORD).
The two corresponding connector inputs cannot be interconnected.
<3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x).
For temperature values, the following applies:
100 °C -> 100 % = 4000 hex or 4000 0000 hex, 0 °C -> 0 %.

<2> The number of PZD receive words depends on the drive object type.
<3> When interconnecting a connector output multiple times all the connector inputs must have either Integer or FloatingPoint data type.
<4> Using the two connector-binector converters, two of the PZD receive words 3 to 20 resp. 5 to 20 can be converted into binectors for continued interconnection.
<5> The following representation applies for words: 4000 hex = 100 %. The reference variables p200x apply for the ongoing interconnection (100 % → p200x).
The following applies for temperature values:
100 °C → 100 % = 4000 hex; 0 °C → 0 %.

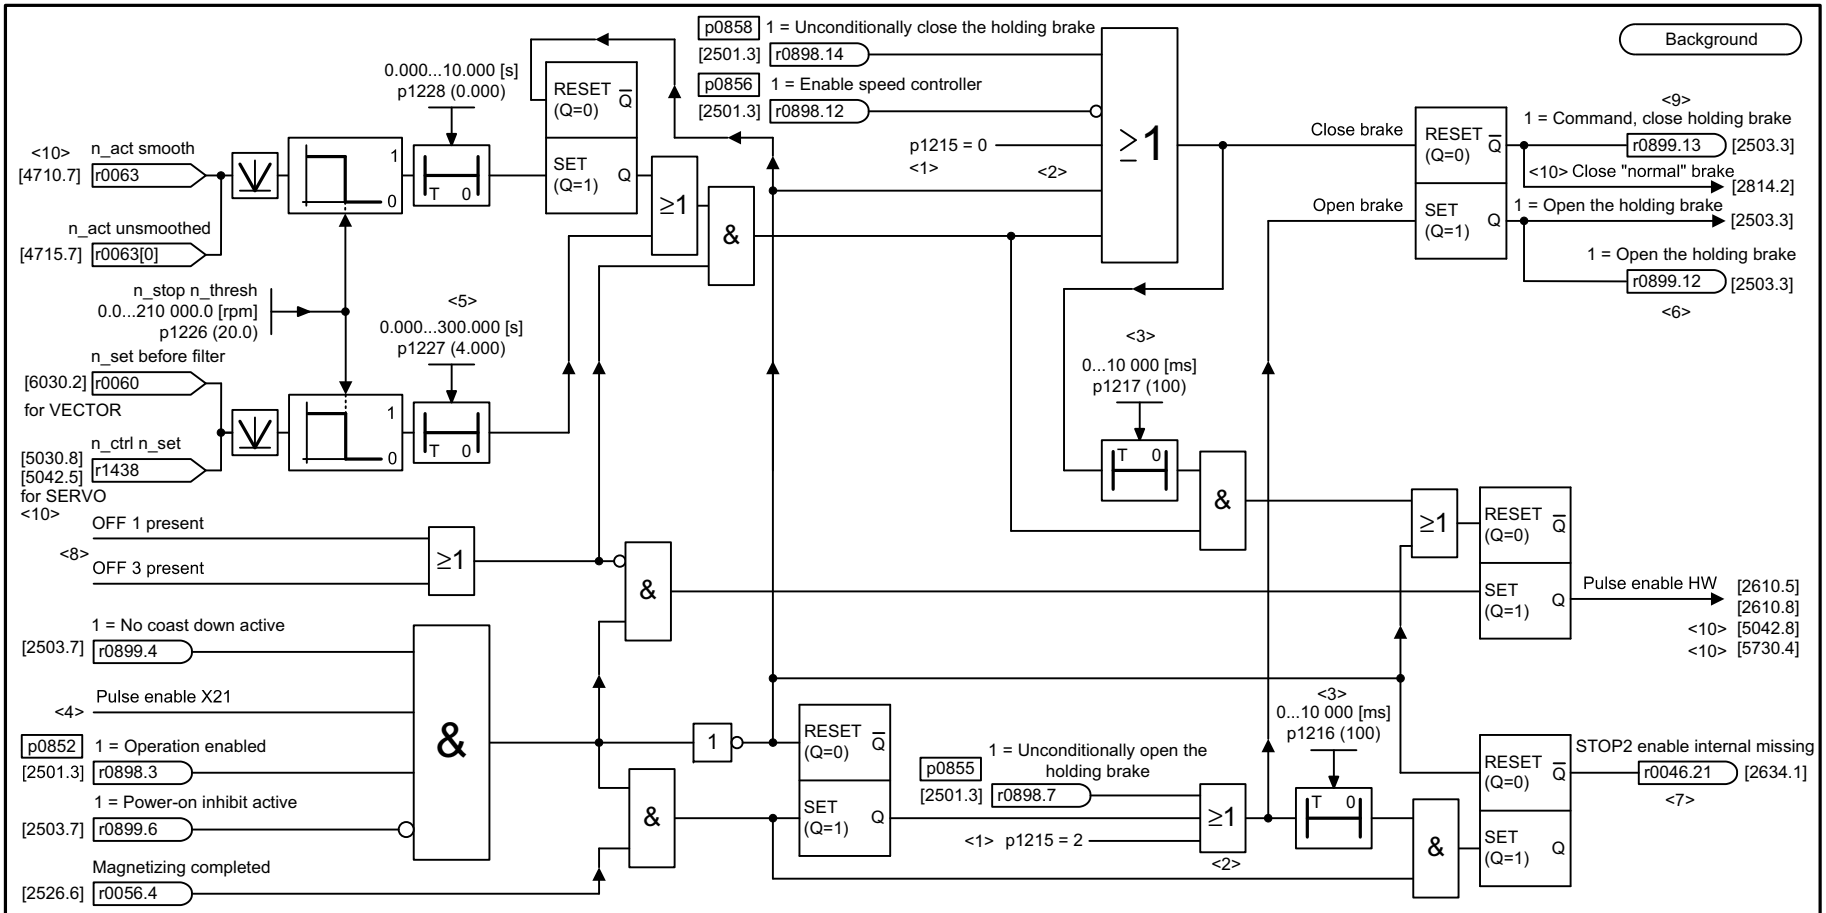
2711 – Extended brake control, signal outputs (r0108.14 = 1)	2229



<1> Motor holding brake configuration (p1215)
0 = No motor holding brake being used.
1 = Motor holding brake acc. to sequence control.
2 = Motor holding brake always released.
3 = Motor holding brake like sequence control, connection via BICO.
<2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
<3> If p1215 = 0, 2 -> t = 0 ms.
<4> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
<5> For p1227 = 300 s, the monitoring function is deactivated.
<6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
<7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or power-on inhibit).
The signal generation is shown simplified.
<8> The internal signal includes signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
<9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.
<10> Only for SINAMICS S120.

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay). <10>
Note: With VECTOR with activated "parallel circuit" Function Module (r0108.15 = 1), the holding brake may only be connected to a power unit (p7015).

<1> Shutdown threshold of the standstill detection. In this case (e.g. when using a brake), another criterion than the speed actual value can be selected to clear the pulses. Otherwise, we recommend to keep the factory setting.
<2> For p1276 = 300.000 s, the timer is deactivated, i.e. the timer output is always 0. Note: When operating a motor with a brake which must not be applied while the motor is rotating, the monitoring time of both timers must be set to 300 s.
<3> For operation without brake, p1224[0...3] must be 0 (factory setting) in order to avoid undesirable interaction with the sequence control.
<4> The internal signal comprises signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
<5> Only for SINAMICS S120.

1 = Brake control active (brake connected to the power unit)
2 = Brake always released (brake connected to the power unit)
3 = Brake control active (brake connection can be interconnected using BICO)
Note:
A motor brake cannot be connected to all power units. p1215 is set to 3 and the brake is controlled via a digital output (e.g. TM31).
<2> Priority assignment (high -> low): p1215, p0858, p0855, p0856/p1219, apply brake from standstill detection, p1218.
<3> These blocks/modules are evaluated with the same sampling rate as the brake control and therefore may only be used to individually adapt the brake control.
<4> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait until the brake is released or applied.

<1> For p1145 > 0, ramp-function generator tracking is activated when the torque limiting responds. This means that the speed controller output only exceeds the torque limit by a deviation that can be set via p1145.
<2> For OFF1/OFF3, the ramp-function generator ramp is active. The ramp-function generator is set (SERVO: to the actual value, VECTOR, VECTOR3P, VECTORGL, VECTORSL: to the setpoint (r1170)) and stops the drive with the ramp-downtime (p1121 or p1135). STW1.4 (enable ramp-function generator) is effective while the drive is stopped via the ramp-function generator. Depending on the p1115, the basic ramp-function generator [3060] or the extended ramp-function generator [3070] is effective.
For SERVO is valid: When the function module "extended setpoint channel" is not active (r0108.8 = 0), for OFF1/OFF3 the down ramp of the basic ramp-function generator is effective (refer to n_set_4 on [3060.8]).
<3> The interpolator is only active with activated "basic positioner" Function Module or with isochronous PROFIdrive mode and sign of life received by the master (STW2.12 ... STW2.15).
<4> Behavior of the response ramp of the torque limiting:
p1145 = 0.0: No ramp-function generator tracking. The ramp-function generator ramp is no longer in the range of the speed actual value.
p1145 = 1.0: The ramp-function generator ramp remains as close as possible to the speed actual value.
p1145 > 1.0: The ramp-function generator ramp is steeper than for p1145 = 1.0 (higher "speed following error").
<5> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).
<6> For SERVO only.
<7> For VECTOR, VECTOR3P only.
<8> For VECTORGL only.
<9> For VECTOR3P, VECTORM2C, VECTORSL only.

<1> Principle of operation of Dynamic Servo Control (DSC): The feedback branch {2} completely compensates the feedback coupling branch {1} in respect of the position actual value sent from the drive. The fast actual value channel {3} allows for a high dynamic performance and high Kv factors.

<2> For the motor encoder (p1192 = 1) p1193 = 1 is effective.
When using encoder 2 or 3 (p1192 = 2, 3), p1193 corresponds to the "Increments per motor encoder revolution/increments of the encoder selected (2, 3) during one motor rotation" (considering gear ratios and also different encoder lines and fine resolutions).

<3> The deadtime for the PROFIdrive data transfer is set automatically.

<4> The position deviation must be referred to the increments of the motor including the fine resolution.

<5> Normalization of KPC: If signal Δx = 1 motor revolution and KPC = 1, then "n_set from DSC" = 0.001 motor revolutions/s.

<6> Clock-synchronous operation must be active for DSC.

<7> Only for p1400.17 = 1 and at limitation becomes p1407.19 = 1.

<8> With active symmetrization (T_SYMM > 0), the speed feedforward value is balanced using the sum of the following time constants:
T_SYMM (refer to p1195) + T_SYMM_ADD (p1427) + 0.5 * T_Speed controller (p0115[1]).

<9> It is actualised with every DRIVE-CLiQ base tact.

[4010.8] <1> If no reference cam exists, the axis directly moves to the zero mark (in the defined start direction). Without a reference cam, the tolerance bandwidth is not evaluated.
<2> When "flying referencing" is selected (passive referencing, p2597 = 1 signal), this function diagram is of no significance => refer to [3614].
<3> The connector outputs are only supplied with values from here if the “referencing“ mode is active.
<4> The reversing cams are low active. When a cam is actuated, motion (reference cam search) is continued in the opposite direction.
<5> Reference point setting is only effective in the initial state [3625].

<1> The changeover to U/f control is represented at [5730.2].
<2> For p1349 = 0: Limit at 0.95 x $f_{Mot\,N}$ <= 45 Hz.
<3> Max. ramp steepness is also influenced by Vdc controller (p1240 ≠ 0).
<4> For synchronous motors, only speed setpoints with up to approximate 25 % of the rated speed can be used in order to prevent any risk of resonant oscillation.

Fig. 3-221 5609 – Generation of the torque limits, overview

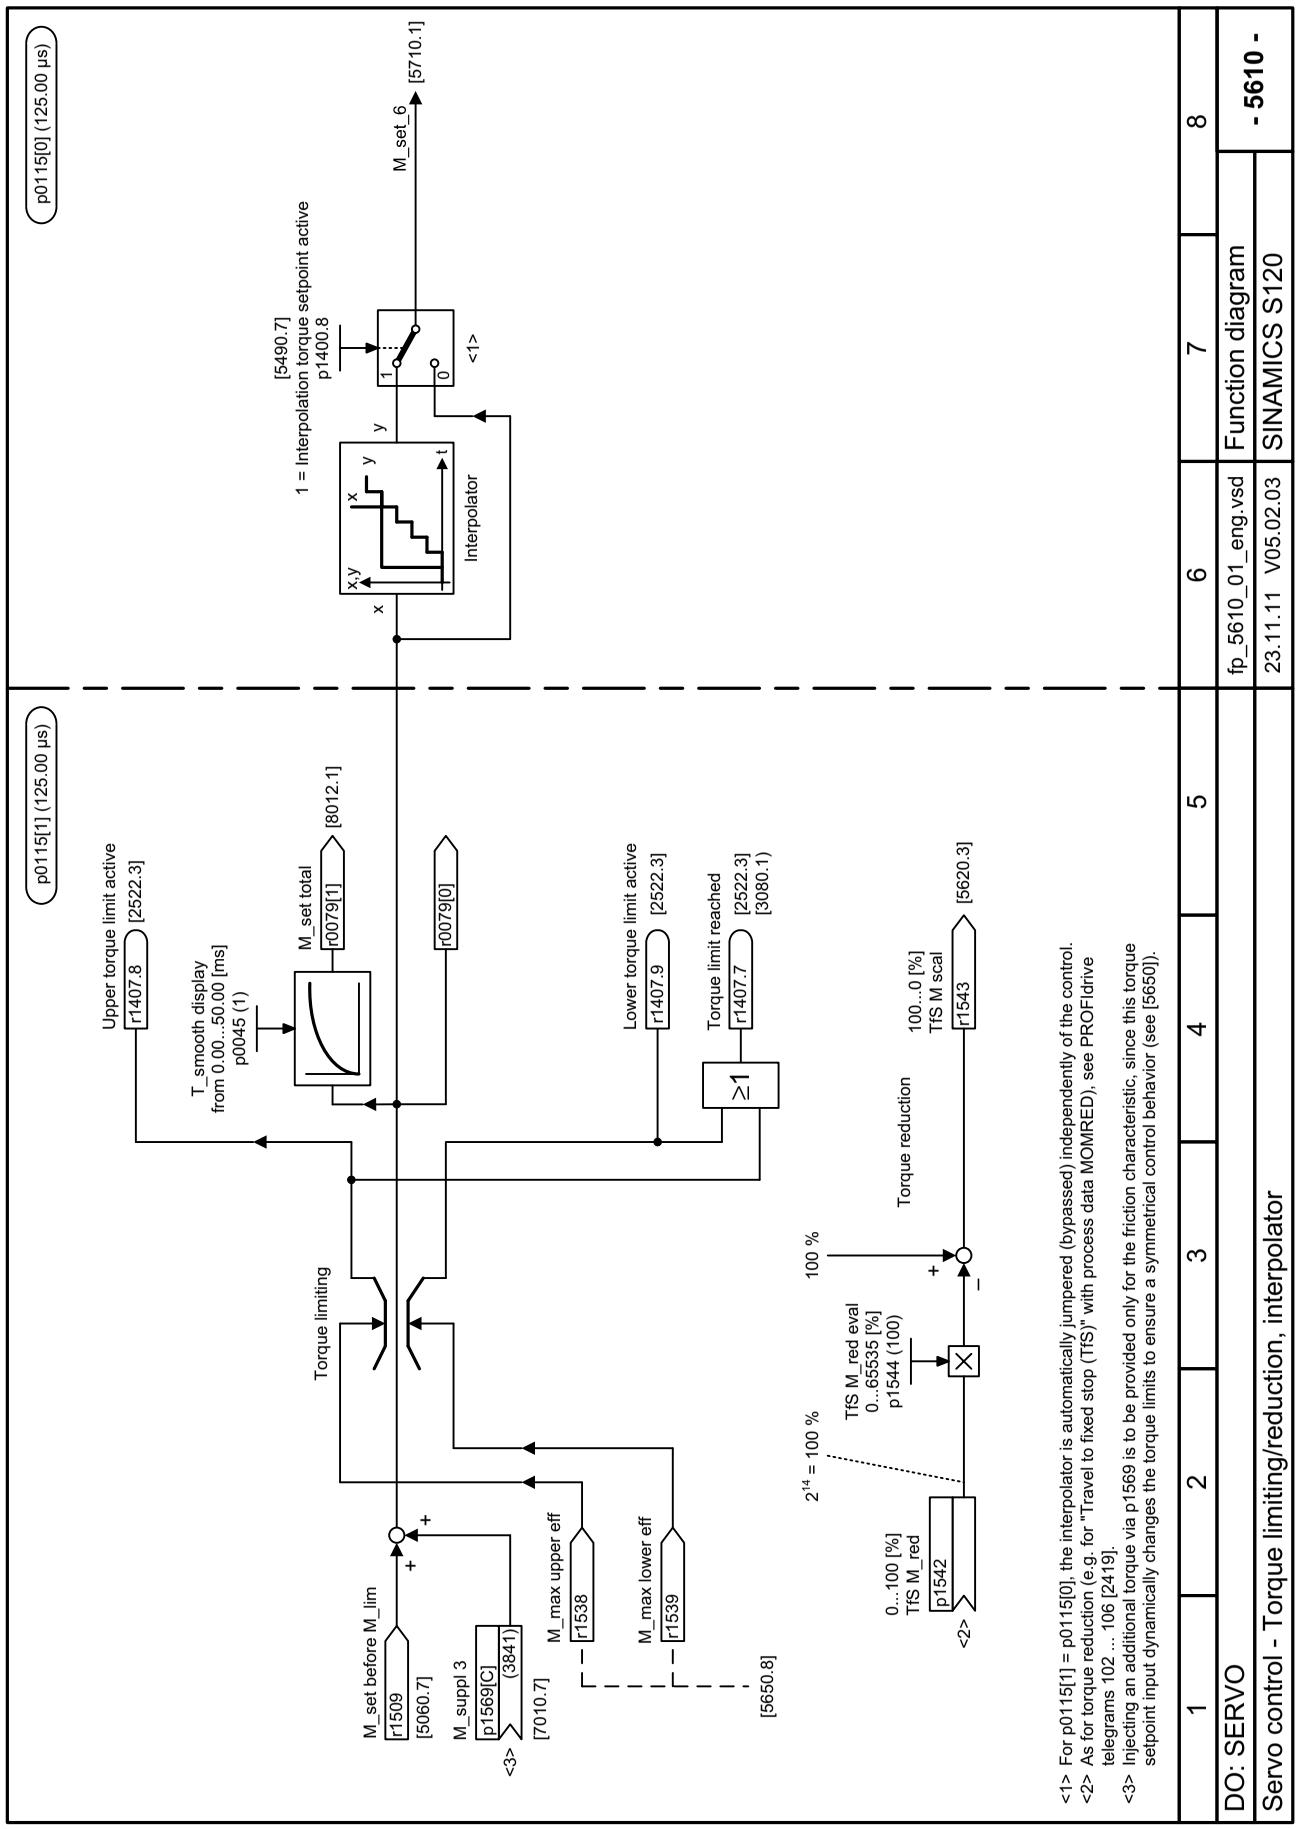

Fig. 3-222 5610 – Torque limiting/reduction, interpolator

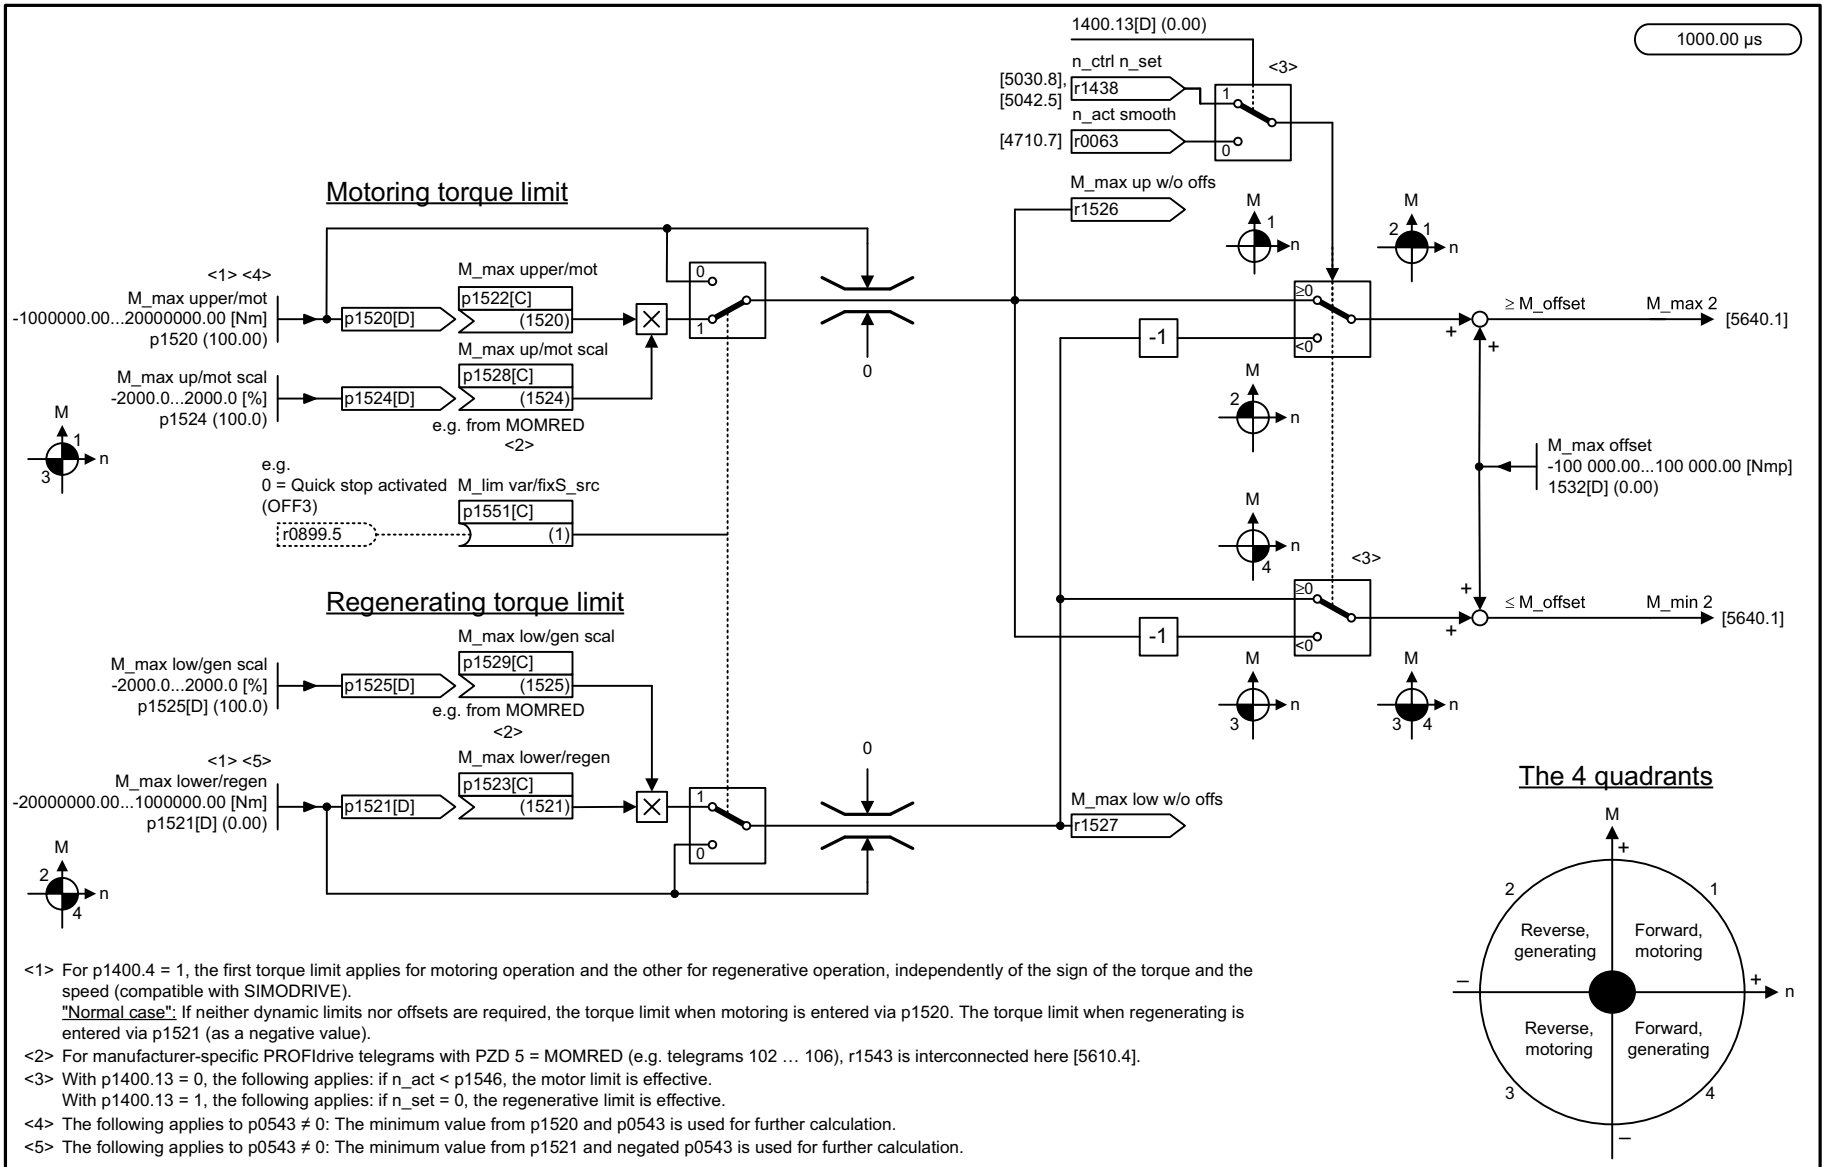

<1> For p1400.4 = 1, the first torque limit applies for motoring operation and the other for regenerative operation, independently of the sign of the torque and the speed (compatible with SIMODRIVE).
"Normal case": If neither dynamic limits nor offsets are required, the torque limit when motoring is entered via p1520. The torque limit when regenerating is entered via p1521 (as a negative value).

<2> For manufacturer-specific PROFIdrive telegrams with PZD 5 = MOMRED (e.g. telegrams 102 … 106), r1543 is interconnected here [5610.4].

<3> With p1400.13 = 0, the following applies: if n_act < p1546, the motor limit is effective.
With p1400.13 = 1, the following applies: if n_set = 0, the regenerative limit is effective.

<4> The following applies to p0543 ≠ 0: The minimum value from p1520 and p0543 is used for further calculation.

<5> The following applies to p0543 ≠ 0: The minimum value from p1521 and negated p0543 is used for further calculation.

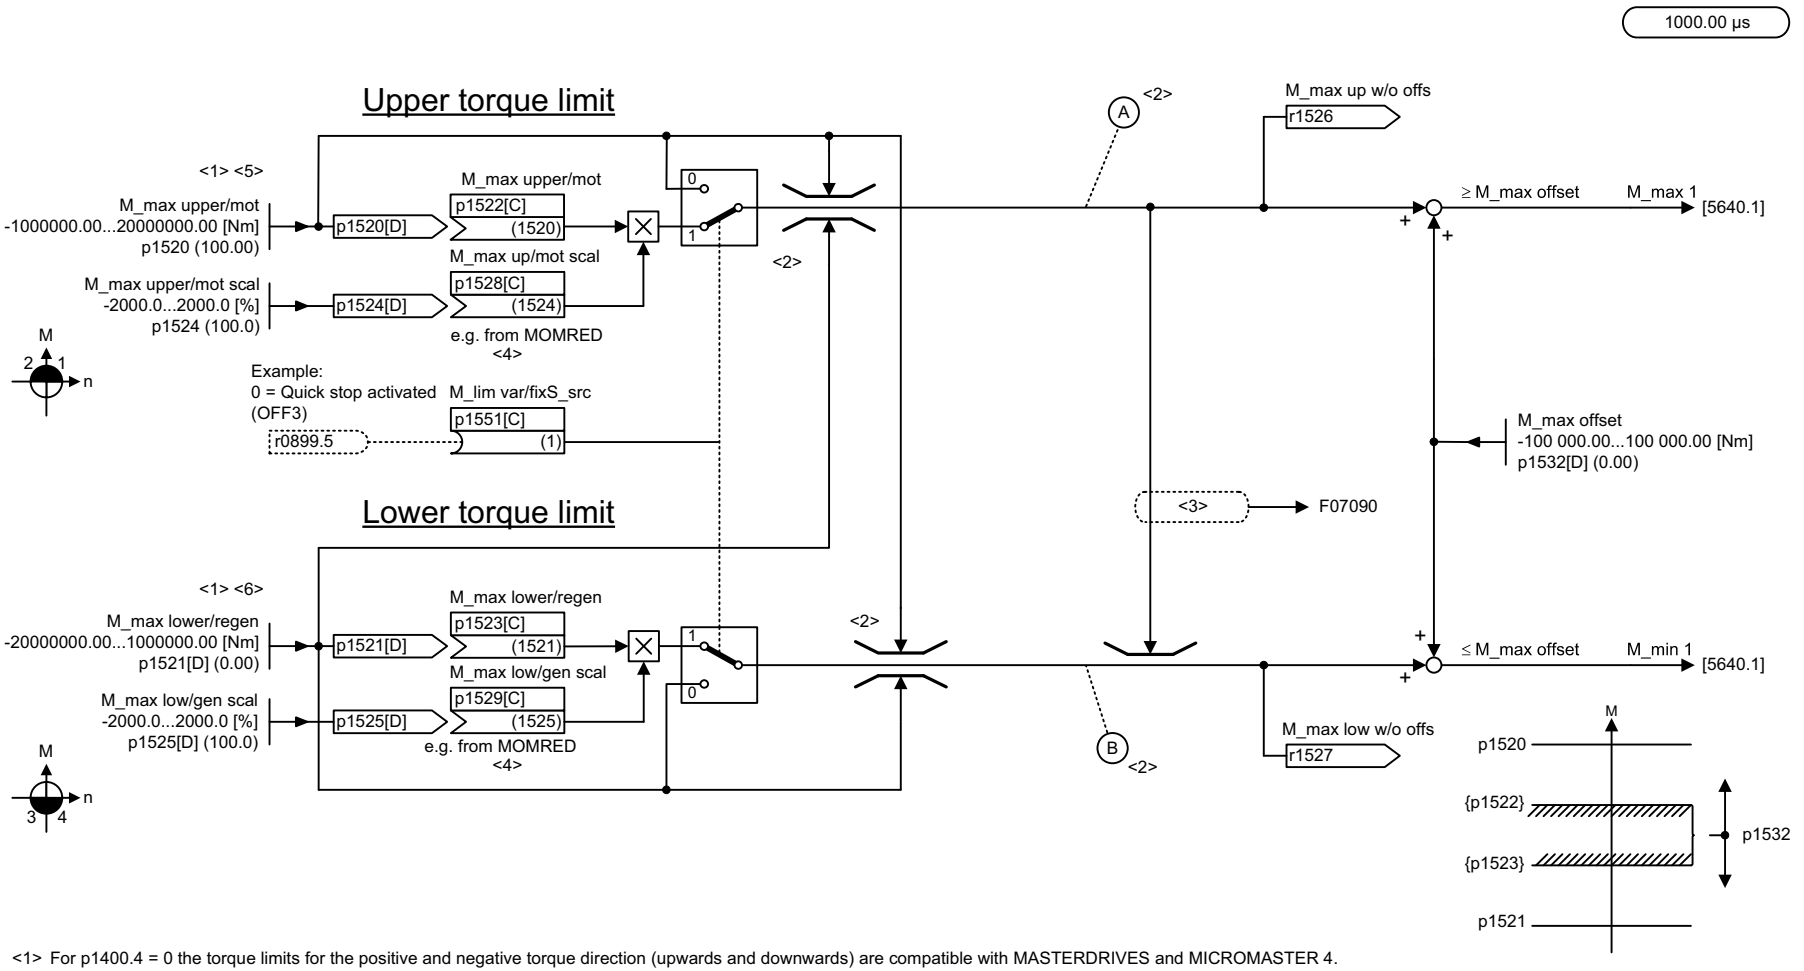
Fig. 3-223 5620 – Motoring/generating torque limit



<1> For p1400.4 = 0 the torque limits for the positive and negative torque direction (upwards and downwards) are compatible with MASTERDRIVES and MICROMASTER 4.
"Normal case": If neither dynamic limits nor offsets are required, the upper torque limit is entered via p1520 and the lower via p1521 (as a negative value).

<2> Danger: Negative values at (A) or positive values at (B) represent a minimum torque for the other torque direction and can cause the motor to accelerate uncontrollably.

<3> The limiter ensure that the limits do not mutually "overtake" one another. With (A) < (B) , fault F07090 is initiated.

<4> For manufacturer-specific PROFIdrive telegrams withPZD5 = MOMRED (e.g. telegrams 102 ... 106), r1543 is interconnected here [5610.4].

<2> Frozen if the deviation in the excitation current is > p1599. With p1599 = 100 %, the function is deactivated.
<3> If <5> is applicable, the P controller becomes the PI controller (p1592). The whole output is limited. In this case, the integral-action component is maintained. After switching back to the exciting current flux controller, the integral-action component is reduced again.
<4> r1617 = r1508 if the speed controller is enabled (r1776[4] > 0).

<1> For KTY, PT100, PT1000 and PTC, the value p0606 = 0 has a different meaning:
KTY, PT100, PT1000: 0 ≙ The output of the timer is always switched out (logical 0)
PTC: 0 ≙ Delay time = 0 s
<2> The switch-in delay p0607 = 0 suppresses fault F07016.
<3> For KTY, PT100, PT1000 and "No sensor", temperature as defined in the model.
<4> p0606 does not work for alarms via p0616.
<5> Only for motors with DRIVE-CLiQ.
<6> p0601 = 5 can only be evaluated if r0192.15 = 1 and p0600 = 11; PT100 is calibrated via p0624.
<7> The assignment of temperature channels 1 … 4 depends on the hardware used.
<8> The relevant rated response temperature (°C) depends on the temperature sensor chosen by the motor manufacturer.

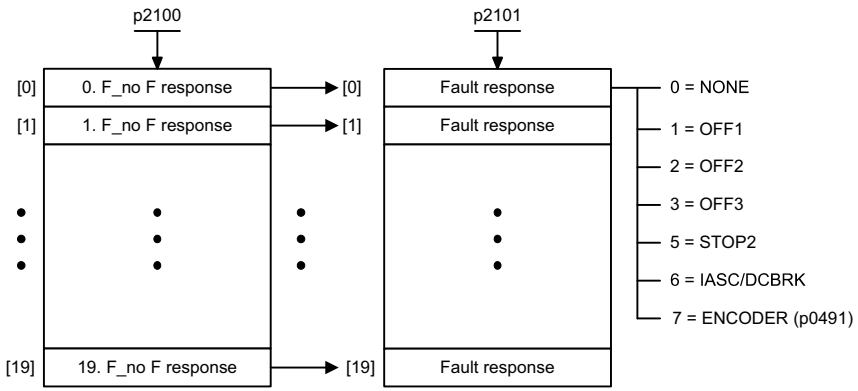
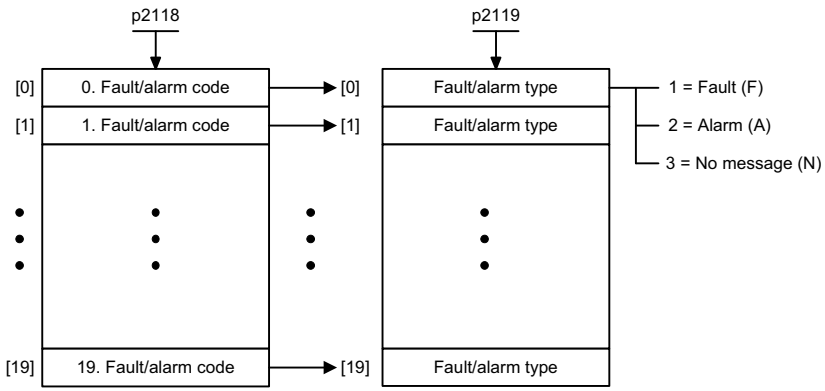
Background

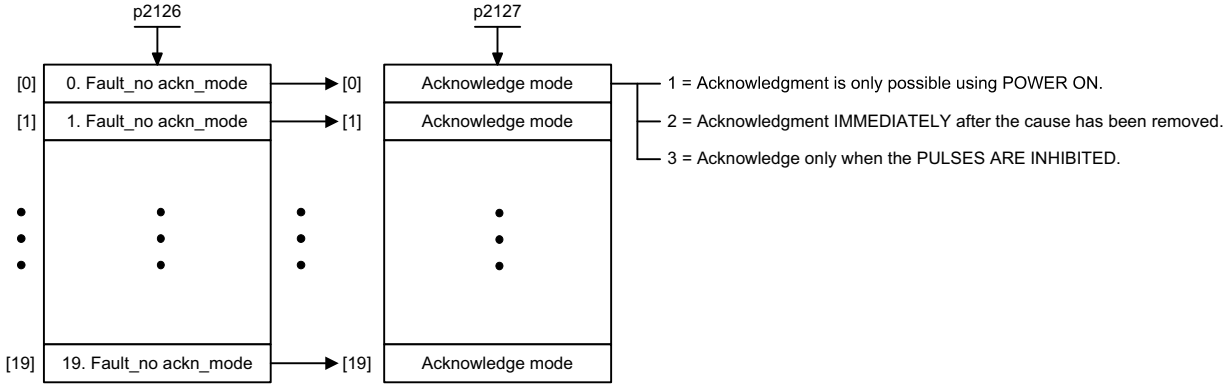
Changing the fault response <1>



Changing the message type (fault <==> alarm) <1>



Changing the acknowledge mode <1>



<1> The fault response, acknowledge mode and message type for all faults and alarms are set to meaningful default values in the factory setting.
Changes that may be required are only possible in specific value ranges specified by SIEMENS.
When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

<1> Only for measuring equipment with Ri ≥ 1 MΩ.
<2> With the factory setting, input values from -100...100 % result in output voltages from 0...4.98 V.
<3> The input signals are determined by the reference quantities p200x (100 % corresponds to p200x). The calculated normalization is indicated via r0786.
<4> Example: If a speed signal is entered via p0071 and r0786 indicates 100.0, a speed change of 100 rpm results in an output voltage change of 1.0 V.

In case of a ground-based input signal, the terminal X521.2 must be connected to the reference potential M.
Caution:
The voltage between an input (X521.1 or X521.2) and the ground point must not exceed 35 V.
When the load resistor is switched in (S5.0 closed), the voltage between the input terminals must not exceed 15 V.

<3> As a result of the wire breakage monitoring the maximum temperature that can be measured is limited to approximate 188.6 °C.

<4> PTC: A value > 250 °C de-activates the alarm or fault.
KTY/PT1000: A value > 188.6 °C de-activates the alarm or fault.

<5> Can only be used with chassis infeeds.

<6> The VECTOR drive object is assigned a dynamic index (p0150).

4.1 Overview of faults and alarms

4.1.1 General information

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	What happens when a fault occurs? • The appropriate fault reaction is initiated • Status signal ZSW1.3 is set. • The fault is entered into the fault buffer. How are faults eliminated? • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	What happens when an alarm occurs? • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. How are alarms eliminated? • Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.

Fault reactions

Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	No reaction when a fault occurs. **Note** When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	**Closed-loop speed control (p1300 = 20, 21)** • n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121). • When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired. **Torque control (p1300 = 23)** • The following applies for torque control: Reaction as for OFF2. • When the system switches to torque control with p1501, the following applies: No separate braking reaction. If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.
OFF1_ DELAYED	-	As for OFF1, however delayed	Faults with this fault response only become effective after the delay time in p3136 has expired. The remaining time up to OFF1 is displayed in r3137.
OFF2	COAST STOP	Internal/external pulse inhibit	**Closed-loop speed and torque control** • Instantaneous pulse suppression, the drive "coasts" to a standstill. • The motor holding brake (if one is being used) is closed immediately. • Switching on inhibited is activated.

Table 4-2 Fault reactions, continued

List	PROFIdrive	Reaction	Description
OFF3	QUICK STOP	Braking along the OFF3 down ramp followed by pulse inhibit	**Closed-loop speed control (p1300 = 20, 21)** • n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). • When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the closing time of the holding brake (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired. • Switching on inhibited is activated. **Torque control (p1300 = 23)** • Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.
STOP2	-	n_set = 0	• n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). • The drive remains in closed-loop speed control.
IASC/ DCBRK	-	-	• For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed. • For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1232, p1233, p1234).
ENCODER	-	Internal/external pulse inhibit (p0491)	The fault reaction ENCODER is applied as a function of the setting in p0491. Factory setting: p0491 = 0 --> Encoder fault causes OFF2 **Notice** When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Table 4-3 Acknowledging faults

Acknowledgment	Description
POWER ON	The fault is acknowledged using POWER ON (switch drive unit off and on again). **Note** If this action has not removed the fault cause, the fault is displayed again immediately after power up.
IMMEDIATELY	Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows: 1 Set acknowledgment by parameter: p3981 = 0 --> 1 2 Acknowledging via binector inputs: p2103 BI: 1 Acknowledge faults p2104 BI: 2 Acknowledge faults p2105 BI: 3 Acknowledge faults 3 Acknowledging using a PROFIDRIVE control signal: STW1.7 = 0 --> 1 (edge) 4 Acknowledge all faults p2102 BI: Acknowledge all faults All of the faults on all of the drive objects of the drive system can be acknowledged using this binector input. **Note** • These faults can also be acknowledged by a POWER ON. • If the cause of the fault has not been removed, the fault will continue to be displayed after acknowledgment. • Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged.
PULSE INHIBIT	The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0). The same options are available for acknowledging as described under acknowledge IMMEDIATELY.
NONE	Acknowledgment can be immediately realized after the cause has been resolved.

4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 2579) has the following layout:

**- - - - - - - - - - - - Start of example - - - - - - - - - - -

Note

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms" (Page 2579) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 2572)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)

  Specifies the "Channel error type" of the PROFINET channel diagnostics.

  When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.

- DS1 (dec)

  Specifies the bit number in date set DS1 of the diagnostic alarm for SIMATIC S7.

  When the diagnostic alarms are activated, the texts listed in the table can be displayed.

- DP (dec)

  Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.

  When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

- ET 200 (dec)

  Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.

  When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.

- NAMUR (r3113.x)

  Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Component:

Type of hardware component that has triggered the fault or alarm.

With "Component: None" it is not possible to assign the message to a hardware component.

Propagation:

In the case of faults that are, for example, triggered by the Control Unit or a Terminal Module, central functions of the drive are also often affected. Using propagation, faults that are triggered by one drive object are therefore passed on to other drive objects.

There are the following types of propagation:

- BICO

  The fault is passed on to all active drive objects with closed-loop control functions (infeed, drive) to which there is a BICO interconnection.

- DRIVE

  The fault is passed on to all active drive objects with closed-loop control functions.

- GLOBAL

  The fault is passed on to all active drive objects.

- LOCAL

  The response of this type of propagation is dependent on parameter p3116.

  With binector input p3116 = 0 (factory setting) the following applies:
  The fault is passed on to the first active drive object with closed-loop control functions.

  With binector input p3116 = 1-signal, the following applies:
  The fault is not passed on.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 2567)

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults" (Page 2569)

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0..63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0..7] and specifies additional, more precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

⚠ **WARNING**
On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

4.1.3 Number ranges of faults and alarms

Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 2579).

Faults and alarms are organized into the following number ranges:

Component: None **Propagation:** LOCAL
Response: NONE
Acknowledgment: NONE
Cause: The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.
Alarm value (r2124, interpret decimal):
Component number of the DRIVE-CLiQ component.
Remedy: Update the firmware using the commissioning tool:
The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.
Firmware update via parameter:
- take the component number from the alarm value and enter into p7828.
- start the firmware download with p7829 = 1.

A01007 POWER ON for DRIVE-CLiQ component required

Message value: Component number: %1
Message class: General drive fault (19)
Drive object: All objects
Component: None **Propagation:** LOCAL
Response: NONE
Acknowledgment: NONE
Cause: A DRIVE-CLiQ component must be switched on again (POWER ON) (e.g. due to a firmware update).
Alarm value (r2124, interpret decimal):
Component number of the DRIVE-CLiQ component.
Note:
For a component number = 1, a POWER ON of the Control Unit is required.
Remedy: - Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again.
- For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.

A01009 (N) CU: Control module overtemperature

Message value: -
Message class: Overtemperature of the electronic components (6)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Response: NONE
Acknowledgment: NONE
Cause: The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.
Remedy: - check the air intake for the Control Unit.
- check the Control Unit fan.
Note:
The alarm is automatically withdrawn once the limit value has been fallen below.

F01010 Drive type unknown

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** GLOBAL
Response: NONE
Acknowledgment: IMMEDIATELY
Cause: An unknown drive type was found.
Fault value (r0949, interpret decimal):
Drive object number (refer to p0101, p0107).
Remedy: - replace Power Module.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

F01011 (N) Download interrupted

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** GLOBAL
Response: NONE
Acknowledgment: IMMEDIATELY

Cause: The project download was interrupted.
Fault value (r0949, interpret decimal):
1: The user prematurely interrupted the project download.
2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).
3: The project download was prematurely exited by the commissioning tool.
100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card".
Note:
The response to an interrupted download is the state "first commissioning".

Remedy: - check the communication cable.
- download the project again.
- boot from previously saved files (switch-off/switch-on or p0976).
- when loading into the file system (download from memory card), use the matching version.

F01012 (N) Project conversion error

Message value: %1
Message class: Hardware/software error (1)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Response: OFF2 (NONE)
Acknowledgment: IMMEDIATELY

Cause: When converting the project of an older firmware version, an error occurred.
Fault value (r0949, interpret decimal):
Parameter number of the parameter causing the error.
For fault value = 600, the following applies:
The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.
Notice:
Monitoring of the motor temperature is no longer ensured.

Remedy: Check the parameter indicated in the fault value and correctly adjust it accordingly.
For fault value = 600:
Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface.
Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.
Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.
Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189.
- if necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly.
- if necessary, upgrade the firmware to a later version.

Cause: The maximum operating time of the fan in the Control Unit has either been reached or exceeded.
Alarm value (r2124, interpret decimal):
0: The maximum fan operating time is 500 hours.
1: The maximum fan operating time has been exceeded (50000 hours).

Remedy: Replace the fan in the Control Unit and reset the operating hours counter to 0 (p3961 = 0).

F01014 Topology: DRIVE-CLiQ component property changed

Message value: Component number: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: None **Propagation:** LOCAL
Response: NONE
Acknowledgment: IMMEDIATELY
Cause: The properties of the DRIVE-CLiQ component have fundamentally changed.
Fault value (r0949, interpret hexadecimal):
Component number.
Remedy: - check the DRIVE-CLiQ component, and if required replace.
- carry out a warm restart (p0009 = 30, p0976 = 2, 3).

Cause: At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.
Alarm value (r2124, interpret decimal):
0: Checksum of one file is incorrect.
1: File missing.
2: File too many.
3: Incorrect firmware version.
4: Incorrect checksum of the back-up file.
Remedy: For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.
Note:
The file involved can be read out using parameter r9925.
The status of the firmware check is displayed using r9926.

Acknowledgment: IMMEDIATELY
Cause: For active PC master control, no sign-of-life was received within the monitoring time.
The master control was returned to the active BICO interconnection.
Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
The monitoring time is set as follows using the commissioning tool:
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
Notice:
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

F01043 Fatal error at project download

Message value: Fault cause: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Response: Infeed: NONE (OFF1, OFF2)
Servo: NONE (OFF1, OFF2, OFF3)
Vector: NONE (OFF1, OFF2, OFF3)
Hla: NONE (OFF1, OFF2, OFF3)
Acknowledgment: IMMEDIATELY
Cause: A fatal error was detected when downloading a project using the commissioning tool.
Fault value (r0949, interpret decimal):
1: Device status cannot be changed to Device Download (drive object ON?).
2: Incorrect drive object number.
3: A drive object that has already been deleted is deleted again.
4: Deleting a drive object that has already been registered for generation.
5: Deleting a drive object that does not exist.
6: Generating an undeleted drive object that already existed.
7: Regenerating a drive object already registered for generation.
8: Maximum number of drive objects that can be generated exceeded.
9: Error while generating a device drive object.
10: Error while generating target topology parameters (p9902 and p9903).
11: Error when generating a drive object (global component).
12: Error when generating a drive object (drive component).
13: Unknown drive object type.
14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).
15: Drive status cannot be changed to drive download.
16: Device status cannot be changed to "ready for operation".
17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.
18: A new download is only possible if the factory settings are restored for the drive unit.
19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)
20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A_INF, SERVO or VECTOR).
21: Error when accepting the download parameters.
22: Software-internal download error.
23: download not possible when know-how protection is activated.
24: download not possible during a partial power up after inserting a component.
25: The configuration is inconsistent. Know-how protection is either not activated or only partially.
Additional values:
Only for internal Siemens troubleshooting.

Remedy: - use the current version of the commissioning tool.
- modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
- change the drive state (is a drive rotating or is there a message/signal?).
- Observe additional active messages/signals and remove their cause (e.g. correct any incorrectly set parameters).
- automatically calculate the control parameters (p0340). Then set p0010 = 0.
- boot from previously saved files (switch-off/switch-on or p0976).
- before a new download, restore the factory setting if the know-how protection was not activated on all drive objects.

F01044 CU: Descriptive data error

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Response: OFF2
Acknowledgment: POWER ON
Cause: An error was detected when loading the descriptive data saved in the non-volatile memory.
Remedy: Replace the memory card or Control Unit.

A01045 CU: Configuring data invalid

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Response: NONE
Acknowledgment: NONE
Cause: An error was detected when evaluating the parameter files PSxxxyyy.ACX, PTxxxyyy.ACX, CAxxxyyy.ACX, or CCxxxyyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted.
Also see r9406 up to r9408.
Alarm value (r2124, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Remedy: - check the parameters displayed in r9406 up to r9408, and correct these if required.
- Restore the factory setting (p0976 = 1) and reload the project into the converter.
Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and this alarm is withdrawn.

A01049 CU: It is not possible to write to file

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Response: NONE
Acknowledgment: NONE
Cause: It is not possible to write into a write-protected file (PSxxxxxx.acx). The write request was interrupted.
Alarm value (r2124, interpret decimal):
Drive object number.
Remedy: Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/...
When required, remove write protection and repeat the save operation (e.g. set p0977 = 1).

F01050 Memory card and device incompatible

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: Control Unit (CU) **Propagation:** GLOBAL

Response: Infeed: OFF2 (NONE, OFF1)
Servo: OFF2 (NONE, OFF1, OFF3)
Vector: OFF2 (NONE, OFF1, OFF3)
Hla: OFF2 (NONE, OFF1, OFF3)

Acknowledgment: IMMEDIATELY

Cause: The memory card and the device type do not match (e.g. a memory card for SINAMICS S is inserted in SINAMICS G).

Remedy: - insert the matching memory card.
- use the matching Control Unit or power unit.

F01054 CU: System limit exceeded

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: Control Unit (CU) **Propagation:** GLOBAL

Response: OFF2

Acknowledgment: IMMEDIATELY

Cause: At least one system overload has been identified.
Fault value (r0949, interpret decimal):
1: Computing time load too high (r9976[1]).
5: Peak load too high (r9976[5]).
Note:
As long as this fault is present, it is not possible to save the parameters (p0971, p0977).
See also: r9976 (System utilization)

Remedy: For fault value = 1, 5:
- reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %.
- check the sampling times and adjust if necessary (p0115, p0799, p4099).
- deactivate function modules.
- deactivate drive objects.
- remove drive objects from the target topology.
- note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology.
When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies:
- the computing time load of the individual runtime groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- if necessary, the assignment of the runtime group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).
- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

Cause: The parameter backup on the memory card and the drive unit do not match.
The module boots with the factory settings.
Example:
Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.
Remedy: - insert a memory card with compatible parameter backup and carry out a POWER ON.
- insert a memory card without parameter backup and carry out a POWER ON.
- save the parameters (p0977 = 1).

F01070 Project/firmware is being downloaded to the memory card

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Control Unit (CU) **Propagation:** GLOBAL

Response: OFF2

Acknowledgment: IMMEDIATELY

Cause: An upgrade (project/firmware download) was initiated on the memory card.

While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated.

Caution:

During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit.

If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.

Remedy: Not necessary.

The fault is automatically withdrawn after the upgrade has been completed.

F01072 Memory card restored from the backup copy

Message value: -

Message class: General drive fault (19)

Drive object: All objects

Component: Control Unit (CU) **Propagation:** LOCAL

Response: NONE

Acknowledgment: IMMEDIATELY

Cause: The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective.

After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.

Remedy: Check that the firmware and parameterization is up-to-date.

A01073 (N) POWER ON required for backup copy on memory card

Message value: -

Message class: General drive fault (19)

Drive object: All objects

Component: Control Unit (CU) **Propagation:** LOCAL

Response: NONE

Acknowledgment: NONE

Cause: The parameter assignment on the visible partition of the memory card has changed.

In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.

Note:

It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).

Remedy: - carry out a POWER ON (switch-off/switch-on) for the Control Unit.

- carry out a hardware reset (RESET button, p0972).

Component: Control Unit (CU) **Propagation:** GLOBAL
Response: OFF2
Acknowledgment: IMMEDIATELY (POWER ON)
Cause: A time slice management error has occurred.
It is possible that the sampling times have been inadmissibly set.
Fault value (r0949, interpret hexadecimal):
998:
Too many time slices occupied by technology functions (e.g. DCC).
999:
Too many time slices occupied by the basic system. Too many different sampling times may have been set.
Additional values:
Only for internal Siemens troubleshooting.
Remedy: - check the sampling time setting (p0112, p0115, p4099, p9500, p9511).

A01223 CU: Sampling time inconsistent

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Response: NONE
Acknowledgment: NONE

Cause: When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified.

Alarm value (r2124, interpret decimal):

1: Value lower than minimum value.

2: Value higher than maximum value.

3: Value not a multiple of 1.25 µs.

4: Value does not match isochronous PROFIBUS operation.

5: Value not a multiple of 125 µs.

6: Value not a multiple of 250 µs.

7: Value not a multiple of 375 µs.

8: Value not a multiple of 400 µs.

10: Special restriction of the drive object violated.

20: On a SERVO with a sampling time of 62.5 µs, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted).

21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account).

30: Value less than 31.25 µs.

31: Value less than 62.5 µs (31.25 µs is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).

32: Value less than 125 µs.

33: Value less than 250 µs.

40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs. Further, none of the nodes has a sampling time of less than 125 µs.

41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 µs.

42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 µs.

43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.

44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).

45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5 µs or 187.5 µs (for a 2x or 3x parallel connection).

46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.

52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 µs.

54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 µs.

56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs.

58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 µs.

99: Inconsistency of cross drive objects detected.

116: Recommended clock cycle in r0116[0...1].

General note:

The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).

The parameters of the sampling times can also be changed with automatic calculations.

Example for highest common denominator: 125 s, 125 µs, 62.5 µs --> 62.5 µs

Remedy: - check the DRIVE-CLiQ cables.

- set a valid sampling time.

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Response: NONE
Acknowledgment: NONE
Cause: When changing the minimum pulse frequency (p0113) inconsistency between the pulse frequencies was identified.
Alarm value (r2124, interpret decimal):
1: Value lower than minimum value.
2: Value higher than maximum value.
3: Resulting sampling time is not a multiple of 1.25 µs.
4: Value does not match isochronous PROFIBUS operation.
10: Special restriction of the drive object violated.
99: Inconsistency of cross drive objects detected.
116: Recommended clock cycle in r0116[0...1].
Remedy: Set a valid pulse frequency.

Response: NONE
Acknowledgment: NONE
Cause: Error when reading the read-write data of the EEPROM in the Control Unit.
Alarm value (r2124, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: For alarm value r2124 < 256, the following applies:
- carry out a POWER ON (switch-off/switch-on).
- replace the Control Unit.
For alarm value r2124 >= 256, the following applies:
- for the drive object with this alarm, clear the fault memory (p0952 = 0).
- as an alternative, clear the fault memory of all drive objects (p2147 = 1).
- replace the Control Unit.

Cause: The hardware description file contains more data than the firmware requires.

Remedy: Not necessary.

A01302 Error in the component trace

Message value: %1

Message class: General drive fault (19)

Drive object: A_INF, B_INF, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: None **Propagation:** LOCAL

Response: NONE

Acknowledgment: NONE

Cause: An error has occurred in the component trace.
The message appears in the following cases:
- upload trace data (p7792 = 1).
- change factory setting (p7790, p7791) for missing property "component trace" (r0193.1 = 0).
Alarm value (r2124, interpret decimal):
1: The DRIVE-CLiQ component does not support the component trace (r0193.1 = 0).
101: Data from trace 1 cannot be read.
102: Data from trace 2 cannot be read.
103: Data from trace 3 cannot be read.
104: Data from trace 4 cannot be read.
105: Data from trace 5 cannot be read.

Remedy: For alarm value = 1:
Upgrade the firmware of the DRIVE-CLiQ component involved.

F01303 Component does not support the required function

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** BICO
Response: OFF2
Acknowledgment: IMMEDIATELY
Cause: A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.
Fault value (r0949, interpret decimal):
1: The component does not support the deactivation.
101: The Motor Module does not support an internal armature short-circuit.
102: The Motor Module does not support the deactivation.
201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.
202: The Sensor Module does not support parking/unparking.
203: The Sensor Module does not support the deactivation.
204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.
205: The Sensor Module does not support the selected temperature evaluation (r0458, r0459).
206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.
207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.
208: The Sensor Module does not support deselection of commutation with zero mark (via p0430.23).
211: The Sensor Module does not support single-track encoders (r0459.10).
212: The Sensor Module does not support LVDT sensors (p4677.0).
213: The Sensor Module does not support the characteristic type (p4662).
214: The power unit does not support the temperature evaluation via PT1000 (r0193).
215: The Terminal Module does not support the temperature evaluation via PT1000
216: The Voltage Sensing Module (VSM) does not support operation with a PT1000 temperature sensor.
Remedy: Upgrade the firmware of the DRIVE-CLiQ component involved.
For fault value = 205, 214, 215:
- check parameter p0600 and p0601 and if required, adapt.
For fault value = 207:
- replace the power unit or if required set the device supply voltage higher (p0210).
For fault value = 208:
- check parameter p0430.23 and reset if necessary.
For fault value = 216:
- check the setting of the sensor type (p3665).
- use a Voltage Sensing module that supports operation with PT1000 (MLFB ...-xxx1).

A01304 (F) Firmware version of DRIVE-CLiQ component is not up-to-date

Message value: %1
Message class: General drive fault (19)

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Response: NONE
Acknowledgment: NONE
Cause: This alarm is used in the following cases:
- if an inactive/non-operational drive object is active again/ready for operation
- if there are items in the list of BI/CI parameters (r9498[0...29], r9499[0...29])
- if the BICO interconnections saved in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) have actually been changed
Remedy: Reset alarm:
- set p9496 to 1 or 2
